

## Early Tertiary Normapolles and Related Palynomorphs of China (III)

Zhichen Song<sup>(1)</sup>

(Received 25 October 1995; accepted 13 September 1996)

**ABSTRACT:** This paper mainly describes the Normapolles and other palynomorphs from the Caomuhao Gypsum Mine strata of the Otog Banner, Inner Mongolia, the Funing Group of northern Jiangsu and the Menli Formation of the Sanmenxia Area in Henan including a total of 24 genera and 66 species. There are 9 new genera, namely *Paleopachydermites*, *Parapeckipollis*, *Paraprenudopollis*, *Paratriangulipollis*, *Paravacuopollis*, *Pseudoproteacidites*, *Spinotriporites*, *Subtriaperturites* and *Trimagnaporites*, 10 new combinataion, 2 nucertain and 42 new species. It is hopes that this paper would bring the Chinese palynologist's attention to the Normapolles and more palynomorphs of this group could be discovered.

**KEY WORDS:** Early Tertiary, Normapolles, China.

This is the third part of my work on Early Tertiary Normapolles and related palynomorphs of China (Song, 1996 a, b). The main treatment is to describe the taxa so far we identify. For this paper only for identification, the following papers were consulted: Goczan *et al.*, 1967; Pflug, 1953; Hao & Chen 1983; Song 1996; Song *et al.*, 1981, 1986; Sun *et al.*, 1979; and Tschudy, 1975.

All specimens have been collected from the Lower Tertiary, the Naomugen Formation of Inner Mangolia unless otherwise stated. All specimens illustrated here are preserved at the Palynological Division of Nanjing Institute of Geology and Palaeontology, Academia Sinica. All figures are at a magnification of x 800 unless otherwise stated.

### PALEOPACHYDERMITES gen. nov.

Type species *Paleopachydermites granulatus* gen. et sp. nov.

Diagnosis: Pollen nearly spherical, outline rounded; exine very thick, over 4  $\mu\text{m}$  in thickness, nexine thin, sexine several times thicker than nexine; homogeneous and without baculate structure; inaperturate, only with one slit dividing palynomorph into two parts; ornamentation variable.

Remarks: *Harskutipollis* Jukasz et Goczan 1985 resembles this new genus in the thick exine and slit, but differs in the nexine thicker than sexine with baculate structure.

1. Nanjing Institute of Geology and Palaeontology, Academia Sinica, Chi-Ming-Ssu, Nanjing 210008, The People's Republic of China.

*Haplocystia* Segroves 1967, *Palynomorphitus* Moore 1963 and *Inderites* Abramova et Marchenko 1964 are also have thick exine, but without circular slit.

This new genus might include *Paleopachydermites* (al. *Monocolpites*) *bisulcus* (Martynova) comb. nov., which occurs from late Upper Cretaceous to Palaeocene of the Vural Area, Russia.

Occurrence: Asia, Late Cretaceous to Early Tertiary.

**Paleopachydermites granulatus gen. et sp. nov.**

P1. 11, figs. 1, 2

Outline circular, holotype ca. 35  $\mu\text{m}$  in diameter; exine 4-5  $\mu\text{m}$  thick, nexine thin, under 1  $\mu\text{m}$  thick, sexine homogeneous, without tectum and baculate structure; inaperturate, a slit dividing palynomorph into two parts; granulate.

*P. bisulcus* (Martynova) comb. nov. differs from the new species in the reticulate ornamentation and the slit bifurcated at terminal end.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 11, fig. 1; slide no.: 681(B-2)

**PARAPECAKIPOLLIS gen. nov.**

Type species *Parapeckipollis elegans gen. et sp. nov.*

Diagnosis: Pollen oblate, amb triangular with straight or slightly concave / convex sides and rounded or obtuse angles; triporate, equato-angulaperturate, pore with vestibula commonly ladder-shaped, pore canal index 0.3-0.4; exopore oval and large, endopore slightly wider than exopore, bearing a clear boundary with body, inner contour circular; exine moderately thick, two layers equally thick or with sexine thicker than nexine, nexine extending to base of vestibula and curved to form endopore, sexine without thickening along pore margin, with inner side uneven; granulate to tuberculate, or microechinate.

Remarks: This new genus differs from *Pecakipollis* Krutzsch 1967 in the large exopore instead of slit exogerminal and the absence of incidence; from *Paravacuopollis* also in the large exopore and clear vestibula (the latter has small exopore and atria, but no vestibula). The inner contour is circular in this genus, but triangular in *Pecakipollis* and *Paravacuopollis*.

Occurrence: China, Late Cretaceous to Early Tertiary.

**Parapeckipollis elegans gen. et sp. nov.**

P1. 11, figs. 3-5

Amb triangular with straight or slightly concave sides and obtuse angles, 25-32  $\mu\text{m}$  (holotype 30  $\mu\text{m}$ ) in diameter; triporate, pore with cylindrical vestibula, pore canal index 0.4; exopore oval, ca. 5  $\mu\text{m}$  wide, endopore ca. 10  $\mu\text{m}$  wide; exine 1-1.5  $\mu\text{m}$  thick, sexine slightly thicker than nexine, with inner side uneven, inner contour formed by nexine circular, about 20  $\mu\text{m}$  in diameter; granulate, coarser in pore area.

This new species resembles *Pecakipollis bohemensis* Krutz. et Pacltova (Goczan et al., 1967, S.487, Taf. 12, Figs. 14-18) in the shape and size, but differs from the latter in the larger exopore and the absence of incidence. *Trudopollis* sp. (Weyland et Krieger, 1953, S. 17, Taf. 5, Figs. 50, 51) is also similar to this new species in the shape but differs from the new species in the thickened exine in pore area and coarser ornamentation.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.  
 Type: Pl. 11, fig. 3; slide no.: 687(B-1)

**Parapecakipollis densus gen. et sp. nov.**

P1. 11, figs. 6-8

Amb triangular with slightly concave sides, angles elongated with rounded or obtuse terminal ends; 35-40  $\mu\text{m}$  (holotype 38  $\mu\text{m}$ ) in diameter; triporate, pore with cylindrical vestibula, pore canal index 0.4-0.5; exopore ca. 5  $\mu\text{m}$  and endopore over 10  $\mu\text{m}$  wide; endobody contour circular, about 25  $\mu\text{m}$  in diameter; exine ca. 1.5  $\mu\text{m}$  thick, sexine thicker than nexine and slightly thickened along base of vestibula and pore margin, with inner side uneven; tuberculate to verrucate.

This new species differs from *P. tuberculatus* in the larger pore canal index (over 0.4) and coarser ornamentation.

Occurrence: Same as the preceding species.

Type: Pl. 11, fig. 6; slide no.: 683(6-3)

**Parapecakipollis tuberculatus gen. et sp. nov.**

P1. 11, figs. 9, 10

Amb triangular with slightly concave / convex sides and rounded angles, holotype 38  $\mu\text{m}$  in diameter; triporate, pore with cylindrical-trapezoidal vestibula, pore canal index 0.4; exopore over 5  $\mu\text{m}$  and endopore ca. 12  $\mu\text{m}$  wide; endobody circular 25-27  $\mu\text{m}$  in diameter; exine ca. 1.5  $\mu\text{m}$  thick; sexine thicker than nexine and slightly thickened along base of vestibula and pore margin, devoid of baculate structure, with inner side uneven; tuberculate-granulate, coarser in vestibula area.

This new species differs from *P. elegans* in the larger size and coarser ornamentation.

Occurrence: Same as the preceding species.

Type: Pl. 11, fig. 9; slide no.: 687(I-1)

**PARAPRENUDOPOLLIS gen. nov.**

Type species *Paraprenudopollis sexangulus gen. et sp. nov.*

Diagnosis: Pollen oblate, amb triangular with straight or slightly concave sides and rounded angles; triporate, angulaperturate, pore probably with atria, exopore oval; exine thin, two layers subequally thick, nexine extending to base of stria and curved, sexine expanded into atria showing punctate or spongy structure; granulate or microechinate.

Remarks: This new genus resembles *Prenudopollis* Kedves et Diniz 1983 in the pore structure, but differs from the latter in the oval exopore and unclear endopore (the latter has colpate exogerminal and porate endogerminal formed by nexine).

Occurrence: China, Early Tertiary.

**Paraprenudopollis sexangulus gen. et sp. nov.**

P1. 11, figs. 11, 12

Amb triangular with slightly concave sides and rounded angles, holotype 30  $\mu\text{m}$  in diameter; triporate, pore with vestibula or atria; exine ca. 1  $\mu\text{m}$  thick in middle part of each side, two layers nearly equal in thickness; pore canal index nearly 0.3, exopore oval, ca. 3  $\mu\text{m}$

wide, endopore larger; atria triangular, in dark colour, and body hexangular; granulate or microbaculate; pore structure as stated in diagnosis of genus.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiay.

Type: Pl. 11, fig. 12; slide no.: 687(7-3)

### **PARATRIANGULIPOLLIS gen. nov.**

Type species *Paratriangulipollis triangulus* (Sung et Lee) gen. et comb. nov.

Diagnosis: Pollen oblate, amb triangular with straight sides and rounded angles; triporate, equatoangulaperturate, pore probably with unclear atria; exine moderately thick, two layers equally thick or with sexine thicker than nexine; exopore small and with annulus; psilate to granulate.

Remarks: The new genus resembles *Triangulipollis* Krutz. 1967 in the outline, but the latter differs in the mesopore, multiatria and elongated exopore. The new genus differs from *Triplopollenites* Pflug 1953 in the triangular shape (the latter has a round outline).

Occurrence: China, Early Tertiary.

**Paratriangulipollis triangulus** (Sung et Lee) gen. et comb. nov. P1. 11, figs. 13-15  
1976 *Triplopollenites triangulus* Sung et Lee, p. 36, pl. 8, fig. 1.

Amb triangular with straight sides and obtuse or rounded angles, 23-30  $\mu\text{m}$  in diameter; triporate, pore small, ca. 2  $\mu\text{m}$  wide; exine ca. 1  $\mu\text{m}$  thick, sexine thickened to 1-1.5  $\mu\text{m}$  in pore area to form thin annulus, inner side of annulus with small and oval atria; scabrate or finely granulate.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiay.

**Paratriangulipollis gracilis** gen. et sp. nov. P1. 11, figs. 16-18  
Amb triangular with straight or slightly concave sides and obtuse angles, 18-20  $\mu\text{m}$  (holotype 18  $\mu\text{m}$ ) in diameter; triporate, pore oval, 2-4  $\mu\text{m}$  wide and with unclear atria; exine under 1  $\mu\text{m}$  in thickness; granulate.

This new species is characterized by the unclear atria and thin exine, without thickening in pore area.

Occurrence: Same as the preceding species.

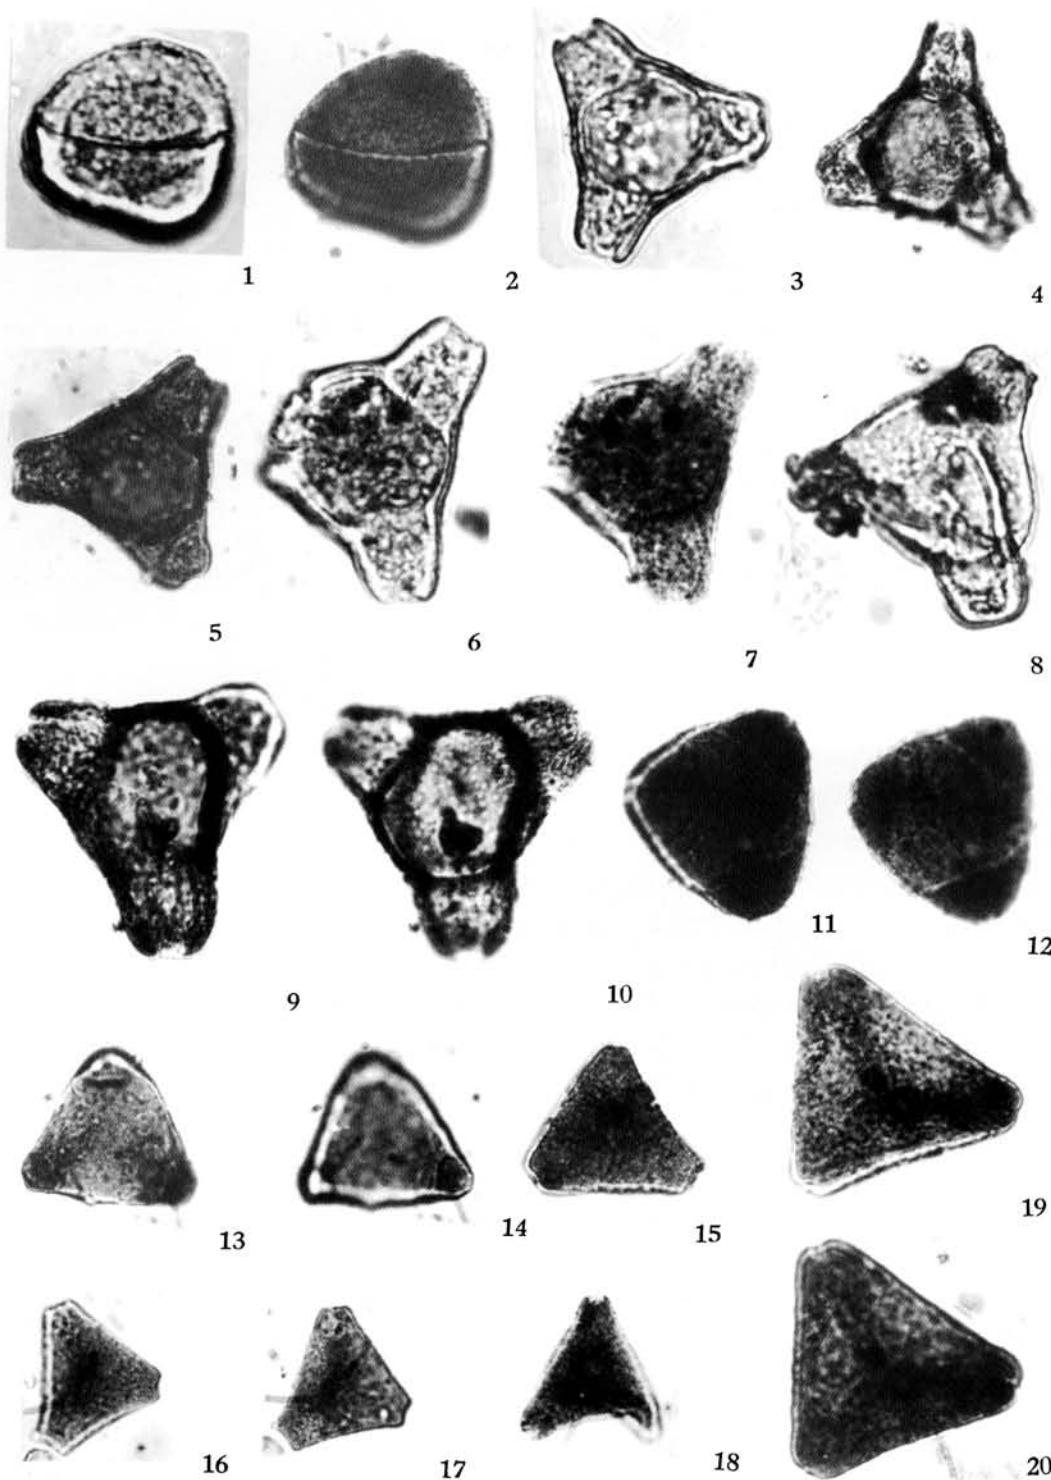

Type: Pl. 11, fig. 16; slide no.: 523(4-1)

**Paratriangulipollis triletoides** gen. et sp. nov. P1. 11, figs. 19, 20  
Amb triangular with straight sides and rounded angles, holotype 38  $\mu\text{m}$  in diameter; triporate, pore simple and oval, 2-3  $\mu\text{m}$  wide; exine 1-2  $\mu\text{m}$  thick and thickened along pore area in dark colour; granulate or microrugulate, outline smooth; triletoid thickening bands extending from angles to pole.

This new species is characterized by the larger size and triletoid bands.

Occurrence: Same as the preceding species.

Type: Pl. 11, fig. 19; slide no.: 479(13-2)

Pl. 11. Figs 1, 2. *Paleopachydermites granulatus* gen. et sp. nov. Slide no.: 681(B-2). Figs. 3-5. *Parapecakipollis elegans* gen. et sp. nov. Slide no.: 687(B-1), 687(12-2). Figs. 6-8. *Parapecakipollis densus* gen. et sp. nov. Slide no.: 683(6-3), 523(D-1). Figs. 9, 10. *Parapecakipollis tuberculatus* gen. et sp. nov. Slide no.: 687(1-1). Figs. 11, 12. *Paraprenudopolis sexangulus*. gen. et sp. nov. Slide no.: 687(7-3). Figs. 13-15. *Paratriangulipollis triangulus* (Sung et Lee). gen. et sp. comb. nov. Slide no.: 479(A-6), 479(C-13). Figs. 16-18. *Paratriangulipollis gracilis* gen. et sp. nov. Slide no.: 523(4-1), 687(1-3). Figs. 19, 20. *Paratriangulipollis triletoides* gen. et sp. nov. Slide no.: 479(13-2).

**PARAVACUOPOLLIS gen. nov.**

Type species *Paravacuopollis tuberculatus gen. et sp. nov.*

**Diagnosis:** Pollen oblate, amb triangular with straight or slightly convex / concave sides and rounded or obtuse angles, inner contour not circular; triporate, equato-angulaperturate, pore without vestibula but with large atria formed by sexine only, pore canal index nearly 0.3; exogerminal oval to round and not slit, endogerminal larger, without clear boundary between body; exine thin to moderately thick, sexine with baculate structure, thicker than nexine and slightly thickened in pore area, with inner side in pore area uneven, nexine extending to base of pore; scabrate, granulate and tuberculate.

**Remarks:** This new genus is very similar to *Vacuopollis* Pflug 1953 in the shape, but differs from the latter in the porate exogerminal, nexine not divided into many layers to form multi-atria. The new genus differs from *Pseudovacuopollis* Krutzsch et Pacltova 1967 which has concave sides, multi-layered nexine and small multi-atria; from *Pecakipollis* Krutzsch et Pacltova 1967 which has clear vestibula and incidens; and from *Osculapollis* Tschudy 1975 which has interlocum.

**Occurrence:** China, Late Cretaceous to Early Tertiary.

**Paravacuopollis tuberculatus gen. et sp. nov.**

P1. 12, figs. 1-3

Amb triangular with slightly concave sides and rounded angles, diameter of holotype 35  $\mu\text{m}$ ; triporate, pore with large atria, pore canal index under 0.3; exopore round, 2-3  $\mu\text{m}$  wide, endopore larger than exopore; exine ca. 1.5  $\mu\text{m}$  thick, sexine with baculate structure, twice thicker than nexine and thickening along pore margin, with its inner side uneven, nexine extending to base of atria; tuberculate.

This new species is characterized by the tuberculate ornamentation.

**Occurrence:** Otog Banner, Inner Mongolia, Lower Tertiary.

**Type:** Pl. 12, fig. 1; slide no.: 687(2-2)

**Paravacuopollis elegans gen. et sp. nov.**

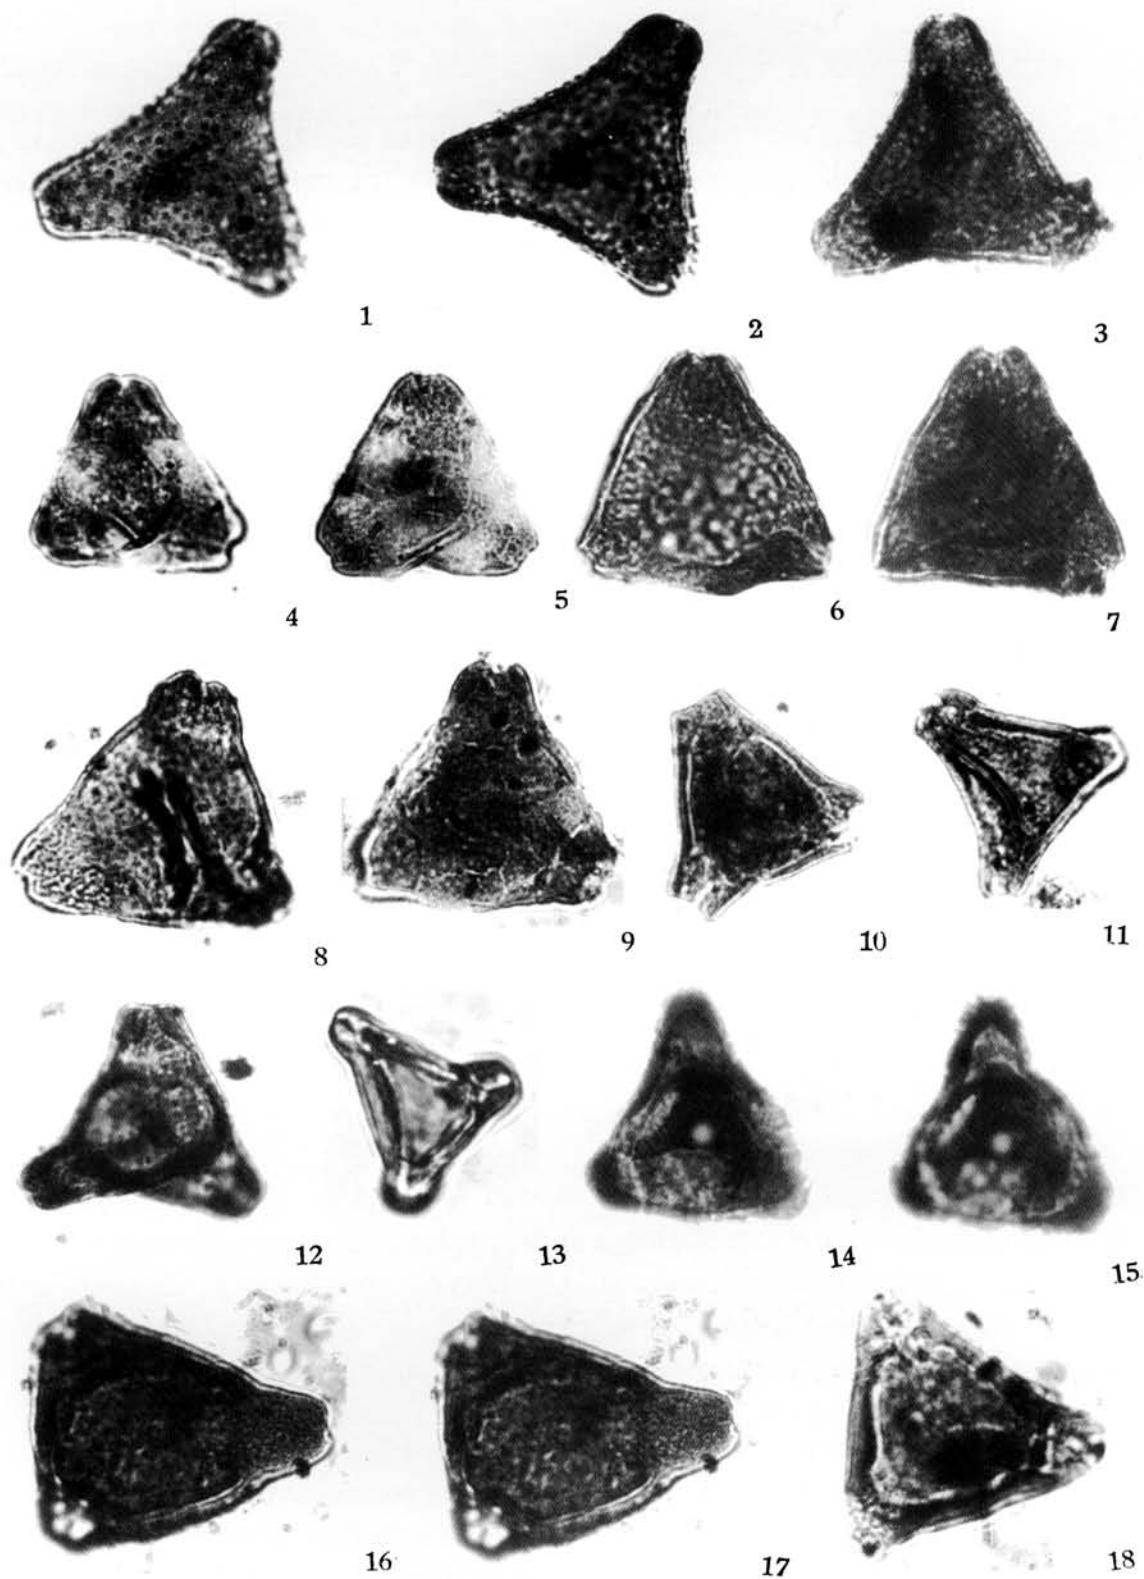

P1. 12, figs. 4, 5

Amb triangular with straight or slightly concave sides and rounded angles, diameter of holotype 25  $\mu\text{m}$ ; triporate, pore with large atria, pore canal index nearly 0.3; exopore round, 2-3  $\mu\text{m}$  wide, endopore larger than exopore; exine ca. 1  $\mu\text{m}$  thick, two layers equally thick, sexine thickened in conclave form along pore margin ca. 1.5  $\mu\text{m}$  thick, with inner side uneven; granulate, coarser in pore area.

This new species is very similar to *Vacuopollis exilis* Pflug (1953, S. 104, Taf. 20, Figs. 15, 16) in the shape, but differs from the latter in the exogerminal, larger atria and thickened sexine along pore margin (the latter has slit exogerminal, without sexine thickening along pore margin). It is also similar to *V. cf. proconcavus* Weyland et Krieger (Pflug, 1953, Taf. 20, fig. 10) in shape, but the holotype of the latter (Weyland et Krieger, 1953, Taf. 2, Fig. 44) has concave sides. The mentioned two species proposed above occur in Upper Cretaceous of Europe.

**Occurrence:** Otog Banner, Inner Mongolia, Lower Tertiary; Sanmenxia Area, Henan, Menli Formation.

**Type:** Pl. 12, fig. 4; slide no.: 523(8-2)

Pl. 12. Figs. 1-3. *Paravacuopollis tuberculatus* gen. et sp. nov. Slide no.: 687(2-2), 683(2-10). Figs. 4, 5. *Paravacuopollis elegans* gen. et sp. nov. Slide no.: 523(8-2), 523(17-1). Figs. 6-9. *Paravacuopollis communis* gen. et sp. nov. Slide no.: 479(14-2), 479(A-1), 683(13-2). Figs. 10-12. *Paravacuopollis granulatus* gen. et sp. nov. Slide no.: 523(2-3), 523(6-2), 683(6-1). Fig. 13. *Plicapollis conserta* Pflug 1953. Slide no.: 479(B-4) Figs. 14, 15. *Pseudoplicapollis otogiensis* sp. nov. Slide no.: 683(7-2) Figs. 16-18. *Prenudopollis major* sp. nov. Slide no.: 683(C-13), 683(C-15).

**Paravacuopollis communis gen. et sp. nov.**

Pl. 12, figs. 6-9

Amb triangular with straight or slightly convex sides and rounded angles, 35-45  $\mu\text{m}$  (holotype 35  $\mu\text{m}$ ) in diameter; triporate, pore with atria, exopore 3-5  $\mu\text{m}$  wide, endopore wider than exopore; exine ca. 1.5  $\mu\text{m}$  thick, sexine thicker than nexine; scabrate to granulate, sometimes tuberculate.

This new species differs from other species of this genus in the triangular shape and larger size; and from *Pseudoproteacidites microverrucatus* in the thin exine and straight sides.

Occurrence: Same as the preceding species.

Type: Pl. 12, fig. 6; slide no.: 479(14-2)

**Paravacuopollis granulatus gen. et sp. nov.**

Pl. 12, figs. 10-12

Amb triangular with straight or slightly concave sides and rounded angles, diameter of holotype 25  $\mu\text{m}$ ; triporate, pore with atria, pore canal index nearly 0.25; exopore round, 2-4  $\mu\text{m}$  and endopore over 5  $\mu\text{m}$  wide; exine 2-2.5  $\mu\text{m}$  thick, sexine twice thicker than nexine with its inner side uneven; microgranulate.

This new species resembles *Conclavipollis purgatus* Pflug (1953, S. 105, Taf. 20, Figs. 40, 41) in shape, but the latter has interlocum, with sexine thickened in pore area, and occurs in Upper Cretaceous of Europe.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 12, fig. 11; slide no.: 523(6-2)

**PLICAPOLLIS** Pflug 1953

Type species: *Plicapollis conserta* Pflug 1953

**Plicapollis conserta** Pflug 1953 Pl. 12, fig. 13

*Plicapollis conserta* Pflug, S. 98, Taf. 19, Fig. 23-27, 32-34 1953.

Amb triangular, diameter 20-25  $\mu\text{m}$ .

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

**PRENUDOPOLLIS** Kedves et Diniz, 1981

Type species *Prenudopollis endocirculus* Kedves et Diiniz 1981

**Prenudopollis major sp. nov.** Pl. 12, figs. 16-18

Amb triangular with straight or slightly convex sides and rounded or obtuse angles, 40-50  $\mu\text{m}$  (holotype 47  $\mu\text{m}$ ) in diameter; triporate, angulaperturate, pore oval; exine 2-3  $\mu\text{m}$  thick, sexine twice thicker than nexine and expanded in pore area to form punctate or spongy structure in atria, nexine extending to base of atria; scabrate to granulate.

This new species differs in the larger size from another species of this genus, which is 22-38  $\mu\text{m}$  in diameter, occurring in the Upper Cretaceous of Portugal (Kedves et Diniz, 1981, p. 26).

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 12, fig. 17; slide no.: 683(C-13).

### PSEUDOPLICAPOLLIS Krutzsch, 1967

Type species *Pseudoplicapollis palaeocaenicus* Krutzsch, 1967

**Pseudoplicapollis otogiensis sp. nov.**

Pl. 12, figs. 14, 15

Amb triangular with straight or slightly concave / convex sides and rounded angles, holotype 30  $\mu\text{m}$  in diameter; triporate, equato-angulaperturate, pore with unclear atria; exine 1.5  $\mu\text{m}$  thick in middle part of sides, nexine thin and extending to pore margin, sexine twice thicker than nexine and gradually thickening to 3  $\mu\text{m}$  in pore area to form annulus, exopore 1-3  $\mu\text{m}$  wide, pore canal slit; a thickened triangular area present, each angle extending only on border but not into atria; granulate.

This new species differs from *P. palaeocaenicus* Krutzsch (Goczan et al., 1967, S. 497, Taf. 14, Figs. 26-31) only in each angle of the thickened triangular area not extending into atria as in the latter.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 12, fig. 14; slide no.: 683(7-2)

### PSEUDOPROTEACIDITES gen. nov.

Type species *Pseudoproteacidites microverrucatus* (Sun et Zhang) gen. et sp. comb. nov.

Diagnosis: Pollen oblate or lenticulate, amb triangular with straight or slightly convex / concave sides and rounded or obtuse angles; triporate, equato-angulaperturate, pore without vestibula but with atria, inner side uneven, denticulate; pore canal index nearly 0.3; exopore and endopore large; exine thin to moderately thick, two layers equal thick or with sexine thicker than nexine, extending to base of pore, sexine slightly thickened in pore area and with unclear baculate structure on inner part; granulate, verrucate and echinate.

Remarks: *Proteacidites* Cookson et Couper 1953 emend. Martin et Harris 1975 is characterized by the nexine which is thicker than sexine, with clear baculate structure and thinned in pore area (in the new genus, on the contrary, the sexine is thicker than nexine, clear baculate structure and slightly thickened in pore area). *Propyliplolis* Martin et Harris 1975 has complicated structure in pore area, *Otogipollis* has elongated angles and pore canal index over 0.4, while *Megatriopollis* Goczan et Krutzsch 1967 has interlocum and small exopore. In these characteristics they all differs from this new genus.

Occurrence: Asia, Late Cretaceous to Early Tertiary.

**Pseudoproteacidites microverrucatus** (Sun et Zhang) gen. et sp. comb. nov. Pl. 13, figs. 1-3

1979 *Proteacidites microverrucatus* Sun et Zhang, p. 289, pl. 2, figs. 7, 8, 10, 11, 13.

1980 *Proteacidites adenanthoides* Cookson, Sun et al., p. 109, pl. 26, fig. 7.

1981 *Proteacidites adenanthoides*, Song et al., p. 121, pl. 35, figs. 16-20.

1986 *Proteacidites adenanthoides*, Song et al., p. 85, pl. 20, figs. 18-22.

Amb triangular or sometimes tetrangular, sides straight or slightly concave and angles rounded or obtuse, 30-50  $\mu\text{m}$  in diameter; triporate, pore with atria, pore canal index 0.3-0.4; exopore 5-11  $\mu\text{m}$  and endopore 9-15  $\mu\text{m}$  wide; exine 1.5-2.5  $\mu\text{m}$  thick, sexine thicker than nexine, slightly thickening in pore area, and showing a baculate structure, nexine extending to base of atria; scabrate to tuberculate.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary; Sanmenxia Area, Henan, Menli Formation; Ya'an County, Sichuan, Yuguangpo Formation; Northern Jiangsu, Funing Group.

**Pseudoproteacidites elongatus gen. et sp. nov.**

Pl. 13, figs. 4-6

Amb triangular with straight or slightly convex sides, angles slightly elongated and terminal ends obtuse; 30-40  $\mu\text{m}$  (holotype 35  $\mu\text{m}$ ) in diameter; triporate; exine 1.5  $\mu\text{m}$  thick, sexine thicker than nexine, slightly thickened and then thinned to form atria in pore area; pore canal index over 0.3; exopore oval, 4-5  $\mu\text{m}$  wide, endopore larger; microgranulate, outline nearly smooth.

The new species is characterized by the slightly elongated angles, fine ornamentation and smooth outline.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary; Sanmenxia Area, Henan, Menli Formation.

Type: Pl. 13, fig. 5; slide no.: 683(A-5)

**Pseudoproteacidites funingensis (Zheng, Qian et Song) gen. et sp. comb. nov.** Pl. 13, figs. 7, 8

1993 *Proteacidites funingensis*, Qian et al., p. 57, pl. 3, Figs. 20, 21.

Amb triangular, diameter 35-40  $\mu\text{m}$ .

Occurrence: North Jiangsu; the 2nd formation of Funing Group.

**Pseudoproteacidites kucheensis (Zhao, Sun et Wang) gen. et sp. comb. nov.** Pl. 13, figs. 9, 10

1982 *Proteacidites kucheensis* Zhao, Sun et Wang, p. 108, pl. 2, figs. 18, 23, 24.

Amb triangular, diameter 33-45  $\mu\text{m}$ .

Occurrence: North Jiangsu, Funing Group; Otog Banner, Inner Mongolia, Lower Tertiary.

**Pseudoproteacidites miniporus gen. et sp. nov.**

Pl. 13, figs. 11-13, 16

Amb triangular with nearly straight sides and acute angles, holotype 36  $\mu\text{m}$  in diameter; triporate; exine 1-1.5  $\mu\text{m}$  thick, two layers subequally thick or with sexine thicker than nexine, sexine thickened (about 2  $\mu\text{m}$ ) at base of pore, becoming thinner and then thickened again along pore margin to form clear atria, nexine extending to base of pore, pore canal index over 0.3; exopore small, ca. 2  $\mu\text{m}$  wide, endopore larger, ca. 10  $\mu\text{m}$  wide; microgranulate.

This new species is characterized by the small exopore.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 13, fig. 11; slide no.: 522(B-2)

**Pseudoproteacidites minutus gen. et sp. nov.**

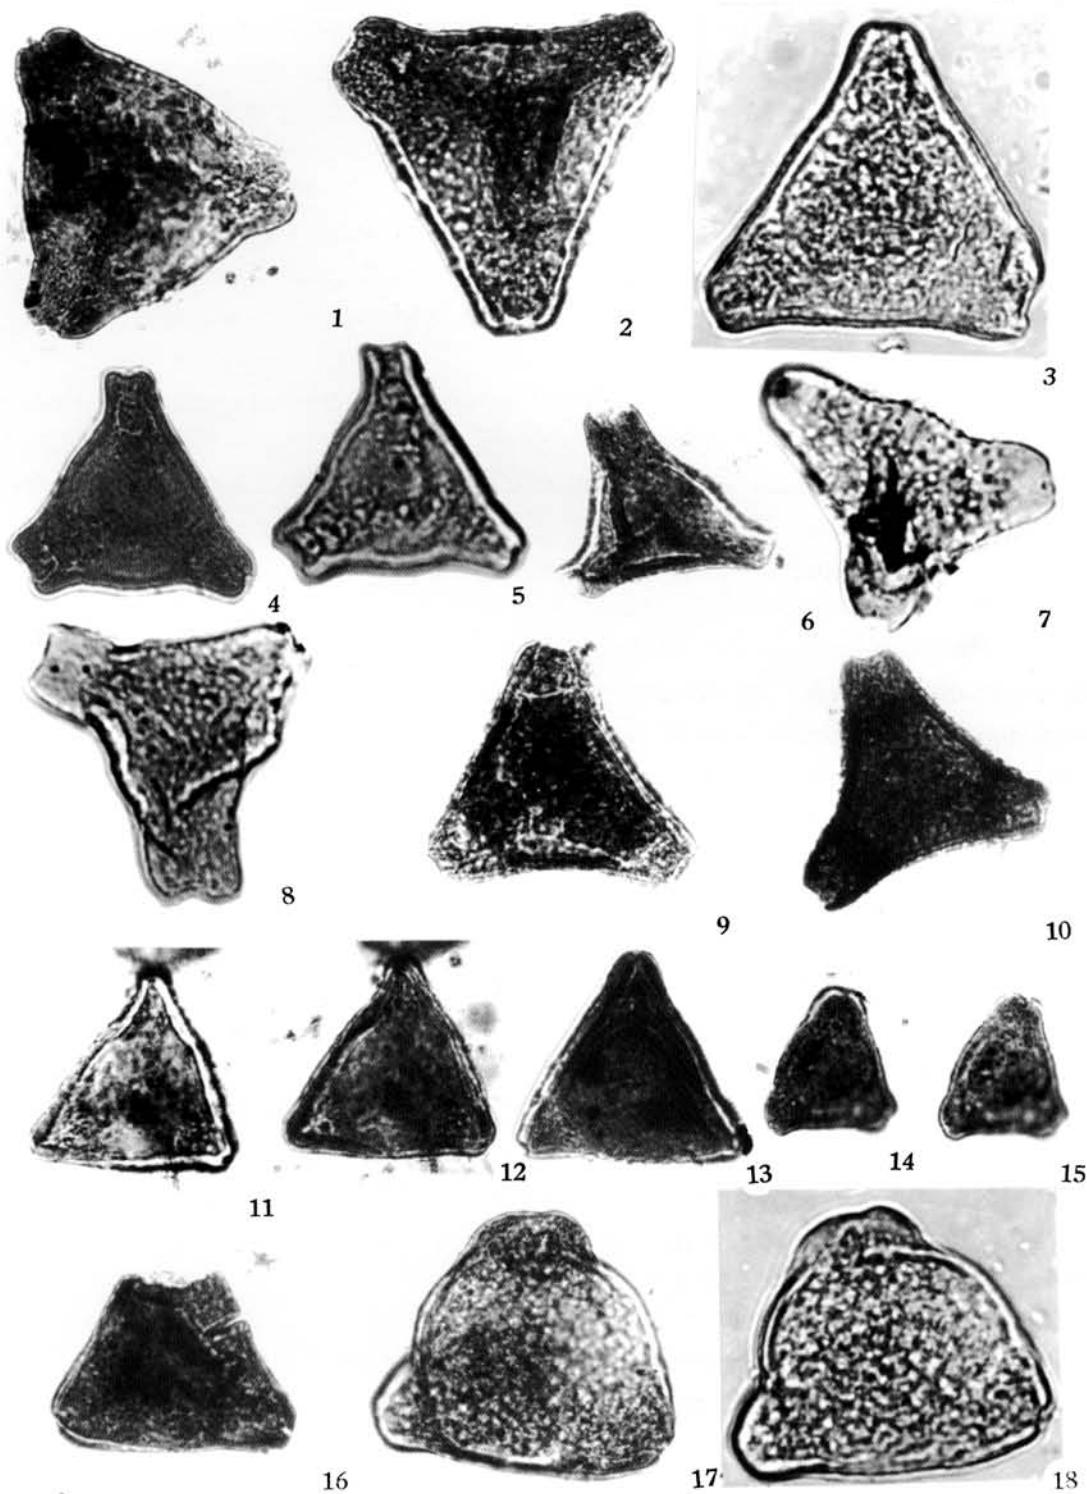

Pl. 13, figs. 14, 15

Amb triangular with nearly straight or slightly convex sides and rounded angles, 18-25  $\mu\text{m}$  (holotype 22  $\mu\text{m}$ ) in diameter; triporate; exine ca. 1.5  $\mu\text{m}$  thick, nexine thin and extending to base of pore, sexine thicker than nexine, becoming thinner at base, and then slightly thickened in atria, with inner side uneven; pore canal index nearly 0.3; exopore oval, ca. 2  $\mu\text{m}$  wide, endopore over 5  $\mu\text{m}$  wide; microgranulate.

This new species is characterized by the small size and relatively thick exine.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 13, fig. 14; slide no.: 683(D-8)

Pl. 13.Figs. 1-3. *Pseudoproteacidites microverrucatus* (Sun et Zhang) gen. et sp. comb. nov. Slide no.: 683(13-1), 683(C-15), 683(D-7). Figs. 4-6. *Pseudoproteacidites elongatus* gen. et sp. nov. Slide no.: 683(A-5), Men 2(2-1). 6. Sanmenxia Area, Henan; Menli Formation. Figs. 7, 8. *Pseudoproteacidites funingensis* (Zheng, Qian et Song) gen. et sp. comb. nov. Slide no.: 870, 637. North Jiangsu; Funing Group. Figs. 9, 10. *Pseudoproteacidites kucheensis* (Zhao, Sun et Wang) gen. et sp. comb. nov. Slide no.: 523(D-11), 683(12-1). Figs. 11-13, 16. *Pseudoproteacidites miniporus* gen. et sp. nov. Slides no.: 522(B-2), 522(C-1), 520(C-2) Figs. 14, 15. *Pseudoproteacidites minutus* gen. et sp. nov. Slide no.: 683(D-8). Figs. 17, 18. *Pseudoproteacidites subrotundus* gen. et sp. nov. Slide no.: 683(A-4).

**Pseudoproteacidites subrotundus gen. et sp. nov.** Pl. 13, figs. 17, 18

Amb roundedly triangular, holotype 50  $\mu\text{m}$  in diameter; triporate, exine 1-1.5  $\mu\text{m}$  thick, two layers subequally thick or with sexine thicker than nexine, sexine slight thickening in pore area and showing punctate structure, nexine extending to base of atria, with inner side uneven, pore canal index nearly 0.3; exopore 4-5  $\mu\text{m}$  and endopore over 10  $\mu\text{m}$  wide; microgranulate or rugulate when eroded, outline nearly smooth.

This new species is characterized by the roundedly triangular amb, which is triangular in other species of this genus.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 13, fig. 17; slide no.: 683(A-4)

**Pseudoproteacidites tantouensis (Zhang) gen. et sp. comb. nov.** Pl. 14, figs. 1-3

1978 *Proteacidites tantouensis* Zhang, p. 553, pl. 153, figs. 5-7.

Amb triangular, diameter 30-40  $\mu\text{m}$ .

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary; Sanmenxia Area, Henan, Menli Formation.

**Pseudoproteacidites tenuis gen. et sp. nov.** Pl. 14, figs. 4, 5

Amb triangular with nearly straight sides and rounded angles, 35-45  $\mu\text{m}$  (holotype 42  $\mu\text{m}$ ) in diameter; triporate; exine 1  $\mu\text{m}$  thick, two layers subequally thick, nexine extending to base of pore, sexine slightly thickened to 2  $\mu\text{m}$  in pore area and showing unclear baculate structure; pore canal index nearly 0.3; exopore 4-8  $\mu\text{m}$  wide and endopore wider; granulate, with a roundedly triangular area on polar area where the exine is thinner.

This new species is characterized by the thin exine and a roundedly triangular area on polar area.

Occurrence: Otog Banner, Inner Mongolia, and Yulin County, Guangxi, Lower Tertiary.

Type: Pl. 14, fig. 5; slide no.: 683(8-2)

**Pseudoproteacidites tenuispinosus (Sun, Zhao et He) gen. et sp. comb. nov.** Pl. 14, figs. 6, 7

1980 *Proteacidites tenuispinosus* Sun, Zhao et He, p. 50, pl. 2, figs. 11, 12.

Amb triangular, diameter 40-50  $\mu\text{m}$ .

Occurrence: same as the preceding species.

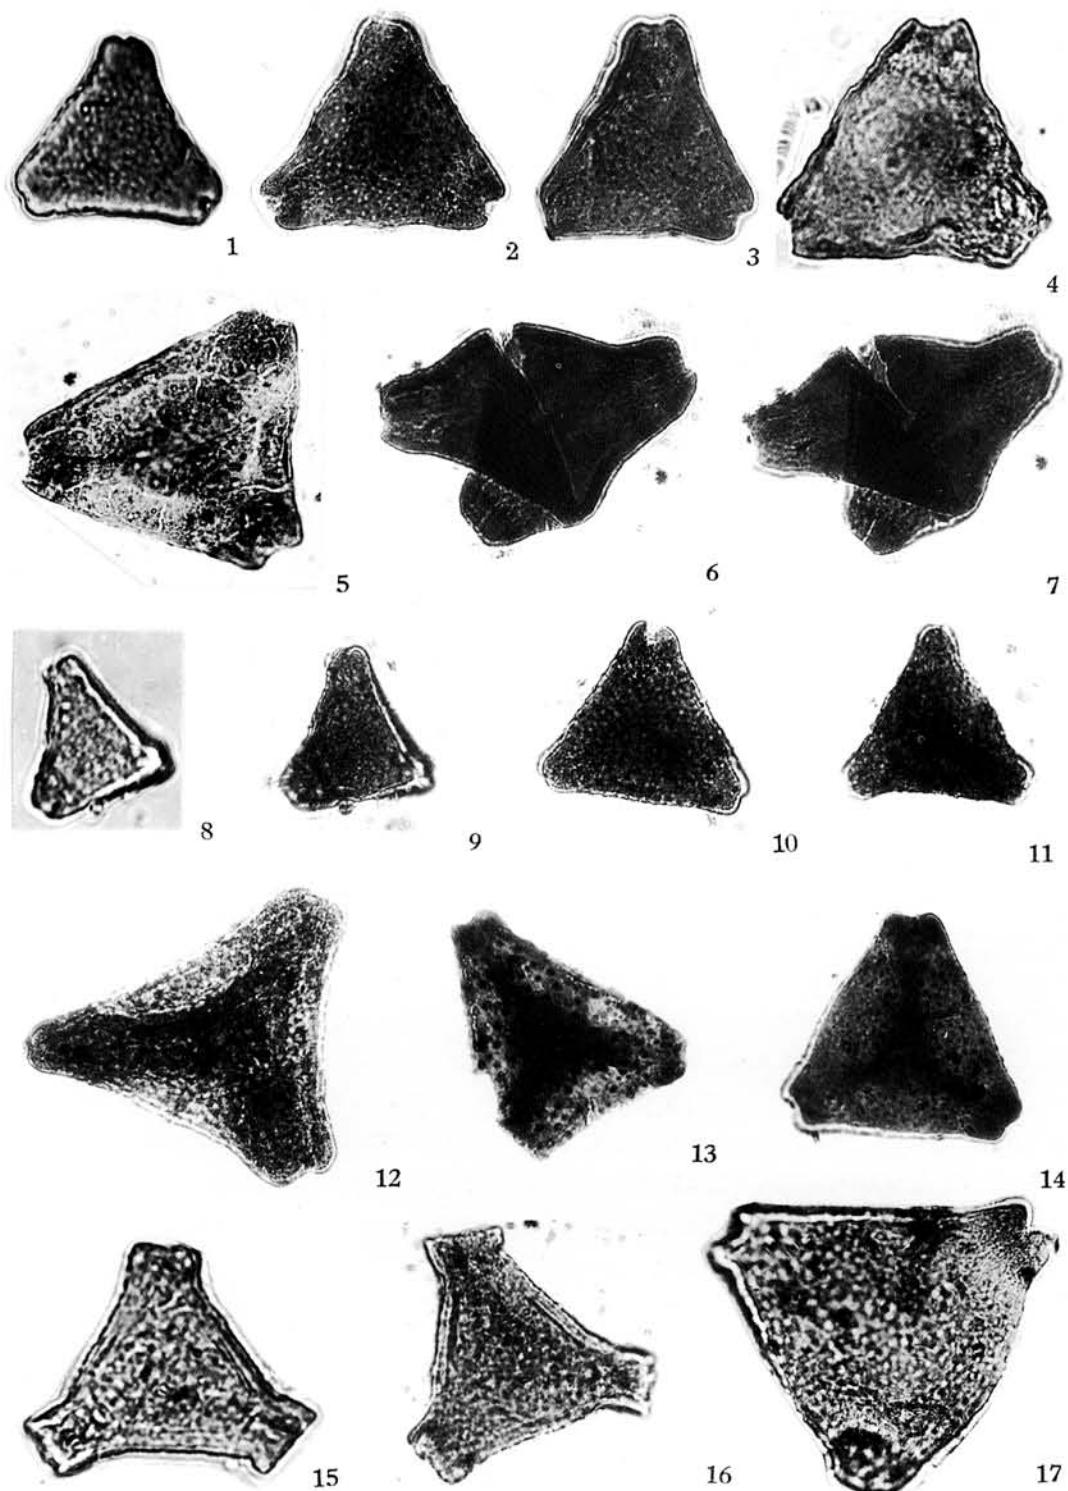

**Pseudoproteacidites triangulus gen. et sp. nov.** Pl. 14, figs. 8-11

Amb triangular with nearly straight sides and acutely rounded angles, 20-30  $\mu\text{m}$  (holotype 25  $\mu\text{m}$ ) in diameter; triporate, pore with atria in triangular shape, pore canal index nearly 0.4; exopore 1-2  $\mu\text{m}$  and endopore over 5  $\mu\text{m}$  wide; exine 1.5  $\mu\text{m}$  thick, sexine thicker than nexine, extending to base of atria, slightly thinned at base of atria and then thickened along pore margin with inner side uneven; scabrate to granulate.

This new species which is also in small size, differs from *P. minutus* in the straight sides and slightly elongated angles. It resembles *Proteacidites tenellus* Wang (1982, p. 86, pl. 1, figs. 15, 16) in the shape, but the latter has microreticulate ornamentation and larger exopore, 4-7  $\mu\text{m}$  wide.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 14, fig. 8; slide no.: 687(7-2)

Pl. 14. Figs. 1-3. *Pseudoproteacidites tantouensis* (Zhang) gen. et sp. comb. nov. Slide no.: 884, Men 3(5-1), San 2(2-1). 1. North Jiangsu; Funing Group. 2, 3 Sanmenxia Area, Henan; Menli Formation. Figs. 4, 5. *Pseudoproteacidites tenuis* gen. et sp. nov. Slide no: 683(8-2). 4. Yulin County, Guangxi; Lower Tertiary. Figs. 6, 7. *Pseudoproteacidites tenuispinosus* (Sun, Zhao et He) gen. et sp. comb. nov. Slide no: 683(16-1). Figs. 8-11. *Pseudoproteacidites triangulus* gen. et sp. nov. Slide no: 687(7-2), 687(10-1), 479(20-1), 523(C-14). Figs. 12-14. *Pseudoproteacidites triletoides* gen. et sp. nov. Slide no: 523(16-1), 365, 687(9-1). 13. North Jiangsu; Funing Group. Figs. 15, 16. *Pseudoproteacidites truncatus* gen. et sp. nov. Slide no: 683(B-4). Fig. 17. *Pseudoproteacidites xiningensis* (Sun, Zhao et He) gen. et sp. comb. nov. Slide no: 683(C-6).

**Pseudoproteacidites triletoides gen. et sp. nov.** Pl. 14, figs. 12-14

Amb triangular, 35-50  $\mu\text{m}$  (holotype 38  $\mu\text{m}$ ) in diameter; triporate; exine 1.5-2  $\mu\text{m}$  thick, granulate to tuberculate, a thickening band like triletes extending from angles to pole.

This new species resembles *P. microverrucatus* in shape and structure, but differs from the latter only in a thickening band like triletes.

Occurrence: Same as *P. microverrucatus*.

Type: Pl. 14, fig. 14; slide no.: 687(9-1)

**Pseudoproteacidites truncatus gen. et sp. nov.** Pl. 14, figs. 15, 16

Amb triangular with straight sides and a cuted angles, slightly projected along terminal margin, 35-40  $\mu\text{m}$  (holotype 38  $\mu\text{m}$ ) in diameter; triporate, pore canal index nearly 0.3; exopore as large as or slightly larger than endopore, ca. 5-6  $\mu\text{m}$  wide; exine 2  $\mu\text{m}$  thick, sexine twice thicker than nexine and slightly thickening along pore margin, baculate structure visible; granulate.

This new species, characterized by the truncate angles and subequally large exopore and endopore, is different from other species of this genus.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 14, fig. 15; slide no.: 683(B-4)

**Pseudoproteacidites xiningensis (Sun, Zhao et He) gen. et sp. comb. nov.** Pl. 14, fig. 17

1980 *Proteacidites xiningensis* Sun, Zhao et He, p. 50, pl. 2, figs. 13-15.

Amb triangular, diameter 35-50  $\mu\text{m}$ .

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary; Sanmenxia Area, Henan, Menli Formatiiion.

**PSEUDOTRUDOPOLLIS Krutzsch, 1967**

Type species *Pseudotrudopollis pseudoalnus* Krutzsch

**Pseudotrudopollis basoides sp. nov.** Pl. 16, figs. 1, 2

1979 *Proteacidites microverrucatus* Sun et Zhang, p1. 2, figs. 10, 11

1987 *Proteacidites* sp. 1., Hao, pl. 38, fig. 4.

Amb tetrangular or pentangular, with concave sides and cylindrical angles, 35-45  $\mu\text{m}$  (holotype 35  $\mu\text{m}$ ) in diameter; tetra- to pentaporate, equato-angulaperturate, pore with cylindrical vestibula formed by highly protruded sexine; exine ca. 1.5  $\mu\text{m}$  thick, sexine thicker than nexine and slightly thickening along pore margin, nexine extending over base of vestibula; granulate to tubercualte.

This new species differs from the type species (*P. pseudoalnus*) of this genus in the concave sides, thin exine and the absence of incidens (the type species has straight sides, thick exine and incidens)

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 16, fig. 2; slide no.: 687(19-1)

### **ROMEINIPOLLENITES** Kedves et Herngreen, 1980

Type species: *Romeinipollenites granulatus* Kedves et Herngreen, 1980

**Romeinipollenites granulatus** Kedves et Herngreen, 1980 Pl. 15, figs. 8, 9, 15-18  
1980 *Romeinipollenites granulatus* Kedves et Herngreen, p. 517, pl. 8, figs. 18-20.

Amb triangular, diameter 30-35  $\mu\text{m}$ .

Occurrence: North Jiangsu, Funing Group.

**Romeinipollenites magnus** sp. nov. Pl. 15, figs. 19-22

Amb roundedly triangular to circular, 40-50  $\mu\text{m}$  (holotype about 40  $\mu\text{m}$ ) in diameter; triaperturate, angulaperturate, exogerminal colpate, half colpus about 1/4-1/3 radius length, endogerminal porate, probably unclear, with narrow and small vestibula on type specimen; exine 4-5  $\mu\text{m}$  thick, tectum as thin as nexine, sexine thicker and thickened at aperturate area; scabrate to microgranulate, outline smooth.

The new species is similar to *R. laevigatus* (Kedves et Herngreen, 1980, p. 517, pl. 9, figs. 1, 2) in shape, but differs from the latter in the porate endogerminal and thin nexine; the latter has thicker nexine (2  $\mu\text{m}$ ) and is smaller in size 28-35  $\mu\text{m}$  in diameter. It differs from *R. tenuicolpatus* in the larger size (over 40  $\mu\text{m}$ ); the latter is 25-38  $\mu\text{m}$  in diameter.

Occurrence: Northern Jiangsu, 2nd and 3rd Formations of Funing Group.

Type: Pl. 15, fig. 19; slide no.: 390

**Romeinipollenites microechinatus** Zheng, Qian et Song 1993 Pl. 15, figs. 5, 10

1993 *Romeinipollenites microechinatus* Qian et al., p. 58, pl. 4, figs. 22-34.

Amb nearly rounded, diameter 35  $\mu\text{m}$ .

Occurrence: Same as the preceding species.

**Romeinipollenites tenuicolpatus** (Sun et He) Zheng, Qian et Song 1993

Pl. 15, figs. 1-4, 6, 7, 12

1980 *Psilabrvitricolpites tenuicolpatus* Sun et He, p. 116, pl. 23, figs 13-16.

1993 *Romeinipollenites tenuicolpatus*, Qian et al., p. 58, pl. 4, figs. 20, 21, 26, 27.

Amb roundedly triangular to circular, diameter 35-40  $\mu\text{m}$ .

Occurrence: Same as the preceding species.

**Romeinipollenites triangulus** sp. nov. Pl. 15, figs. 11, 13, 14

Amb roundedly triangular to circular, 35-40  $\mu\text{m}$  (holotype 35  $\mu\text{m}$ ) in diameter; triaperturate, exogerminal colpate and endogerminal porate, probably with small vestibula; exine solid, scabrate to microgranulate; a small triangular area present on polar area, where the exine is thinner but the ornamentation is coarser than in other parts.

The new species is characterized by the small triangular area on polar area, and differs from other species of this genus.

Occurrence: Same as the preceding speceis.

Type: Pl. 15, fig. 11; slide no.: 847

**Romeinipollenites cf. laevigatus** Kedves et Herngreen, 1980 Pl. 16, figs. 3, 4  
 cf. 1980 *Romeinipollenites laevigatus* Kedves et Herngreen, p. 517, pl. 9, figs 1, 2.  
 Amb nearly circular, diameter 30  $\mu\text{m}$ .  
 Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

### SPINOTRIPORITES gen. nov.

Type species *Spinotriporites unicannulatus* gen. et sp. nov.

Diagnosis: Pollen oblate to spherical, amb triangular to roundedly triangular; triporate, equato-angulaperturate, pore round, probably with small vestibula and atria; exine moderately thick and slightly thickening toward pore, sexine thicker than nexine and probably divided at pore; microechinate or microbaculate, spinae less than 2  $\mu\text{m}$  in length; pollen small to medium in size.

Remarks: This new genus differs from *Echitriporites*, *Diervillapollenites* and *Echibasopollis* in its small size and microspinate ornamentation. It differs from *Weigelapollis* Takahashi 1982 which has subequatorial pore and thin exine; from *Triatriopollenites* which has laevigate to scabrate but no echinate ornamentation, from *Compositoipollenites* Potonie 1951 which has rounded amb and pore not situated on angles, and from *Thomsonpollis* Krutzsch 1960 which has thick exine and complicated pore structure.

Occurrence: China and Central Asia, Late Cretaceous to Early Tertiary.

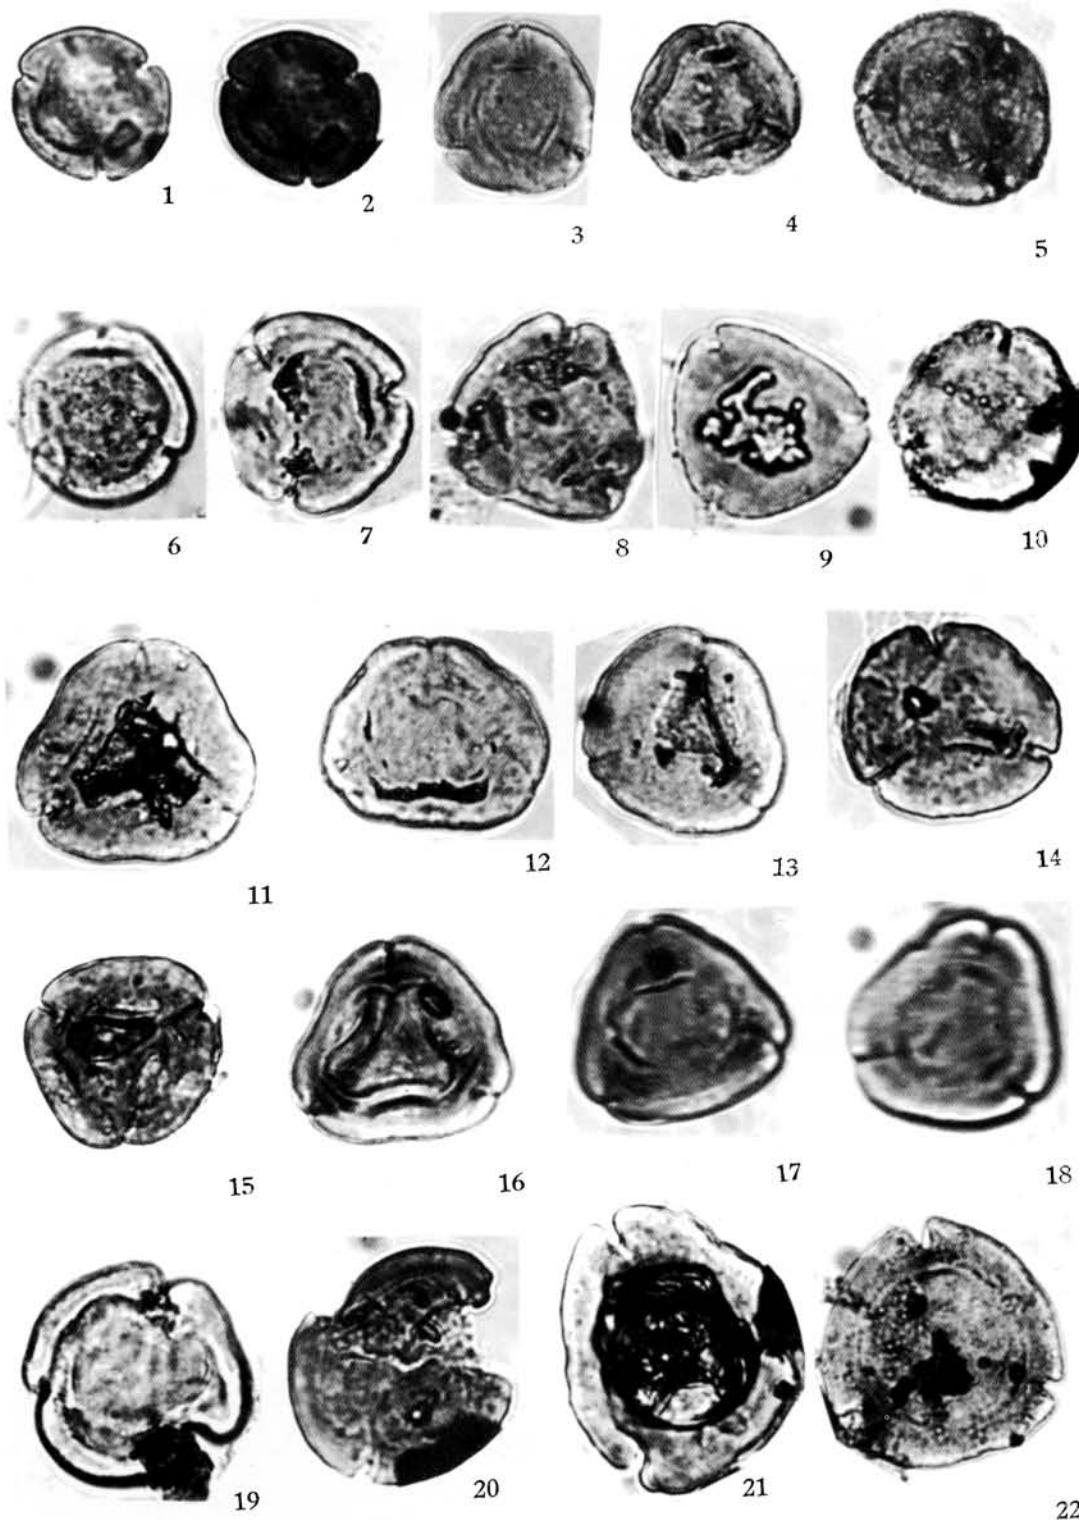

**Spinotriporites echinatus** (Sun et Zheng) gen. et sp. comb. nov. Pl. 17, figs. 1-4  
 1979 *Triatriopollenites echinatus*, Sun et al., p. 290, pl. 2, figs. 14-16, 20.  
 Amb triangular, diameter 30-45  $\mu\text{m}$ .  
 Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary; Sanmenxia Area, Henan, Menli Formation.

**Spinotriporites minor** (Wang, Sun et Zheng) gen. et sp. comb. nov. Pl. 17, figs. 8-13  
 1990 *Echitriporites minor*, Wang et al., p. 122, pl. 17, figs. 28, 29, 34.  
 Amb triangular, diameter 18-35  $\mu\text{m}$ .  
 Occurrence: Same as the preceding species.

**Spinotriporites unicannulatus** gen. et sp. nov. Pl. 16, figs. 5-11  
 Amb triangular to roundedly triangular, diameter 25-35  $\mu\text{m}$  (holotype 30  $\mu\text{m}$ ); triporate, exopore oval, 4-8  $\mu\text{m}$  wide and endopore slightly larger than exopore, pore canal index ca. 0.25; exine 1.5-2.5  $\mu\text{m}$  thick, sexine thicker than nexine and thickened about 4  $\mu\text{m}$  at pore area to form annulus; baculo-spinate, spinae commonly ca. 1  $\mu\text{m}$  long, with grana in between, outline microdenticulate.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary; Sanmenxia Area, Henan, Menli Fornation.

Type: Pl. 16, fig. 5; slide no.: 523(4-2)

Pl. 15. Figs. 1-4, 6, 7, 12 *Romeinipollenites tenuicolpatus* (Sun et He) Zheng, Qian et Song 1993. Slide no: 1020, 50, 613, 830, 445, 738. Figs. 5, 10 *Romeinipollenites microechinatus* Zheng, Qian et Song 1993. Slide no.: 604, 381. Figs. 8, 9, 15-18. *Romeinipollenites granulatus* Kedves et Herngreen 1980. Slide no.: 446, 882, 927, 462, 741, 738. Figs. 11, 13, 14. *Romeinipollenites triangulus* sp. nov. Slide no.: 847, 372, 861. Figs. 19-22. *Romeinipollenites magnus* sp. nov. Slide no.: 390, 848, 335, 605. All specimens of this plate have been collected from Funing Group, North Jiangsu.

**Spinotriporites biannulatus gen. et sp. nov.**

Pl. 16, figs. 12-15

Amb triangular to roundedly triangular, diameter 30-40  $\mu\text{m}$  (holotype 36  $\mu\text{m}$ ); triporate, exopore smaller than endopore, oval, 4-5  $\mu\text{m}$  wide, with long pore canal and small vestibula formed by thickened sexine, which is divided in pore area, pore canal index about 0.3; exine 1.5-2  $\mu\text{m}$  thick, sexine thicker than nexine and thickened to 4-6  $\mu\text{m}$  in pore area; baculo-spinate, spinae commonly 1  $\mu\text{m}$  long, less than 2  $\mu\text{m}$ , sparsely distributed and with puncta in between, outline microdenticulate.

The new species is characterized by strongly thickened sexine in pore area, small vestibula and pore canal index 0.3, which distinguishes it from the type species of this genus.

Occurrence: Same as the preceding species.

Type: Pl. 16, fig. 12; slide no.: 523(7-1)

**Spinotriporites atriaporus gen. et sp. nov.**

Pl. 16, figs. 16-19

Amb triangular with slightly convex sides and rounded angles, 30-40  $\mu\text{m}$  (holotype 35  $\mu\text{m}$ ) in diameter; triporate, exopore oval, 4-5  $\mu\text{m}$  wide; exine ca. 2  $\mu\text{m}$  thick, sexine thicker than nexine and thickened to about 5  $\mu\text{m}$  in pore area, nexine extending to somewhere at 1/2 between pore margin and middle part of each side and divided to form postatrium, about 15  $\mu\text{m}$  wide on holotype; baculo-spinate, spinae less than 2  $\mu\text{m}$  long and with puncta in between them, outline microdenticulate.

This new species is characterized by its postatrium.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 16, fig. 17; slide no.: 683(A-5)

**Spinotriporites annulatus gen. et sp. nov.**

Pl. 16, figs. 20, 21

Amb triangular with slightly convex sides and rounded angles, 30-40  $\mu\text{m}$  (holotype 32  $\mu\text{m}$ ) in diameter; triporate, pore simple, oval, 6-8  $\mu\text{m}$  wide; exine ca. 1.5  $\mu\text{m}$  thick, sexine thicker than nexine and thickened to ca. 2  $\mu\text{m}$  in pore area, nexine not extending into pore area; with an annulus band as thick as exine on subequatorial belt; microspinate, spinae 1-1.5  $\mu\text{m}$  long, outline microdenticulate,

This new species is characterized by its subequatorial annulus band as thick as exine.

Occurrence: Same as the preceding species.

Type: Pl. 16, fig. 20; slide no.: 681(2-1)

**Spinotriporites intrannulatus gen. et sp. nov.**

Pl. 17, figs. 5, 6

Amb roundedly triangular, holotype 30  $\mu\text{m}$  in diameter; triporate, pore oval, ca. 8  $\mu\text{m}$  wide, atria large; exine solid, thickened along inner side in pore area to 5-6  $\mu\text{m}$  in dark colour; microspinate, spinae ca. 1  $\mu\text{m}$  long, outline denticulate.

The new species is characterized by the exine thickened along inner side in pore area.

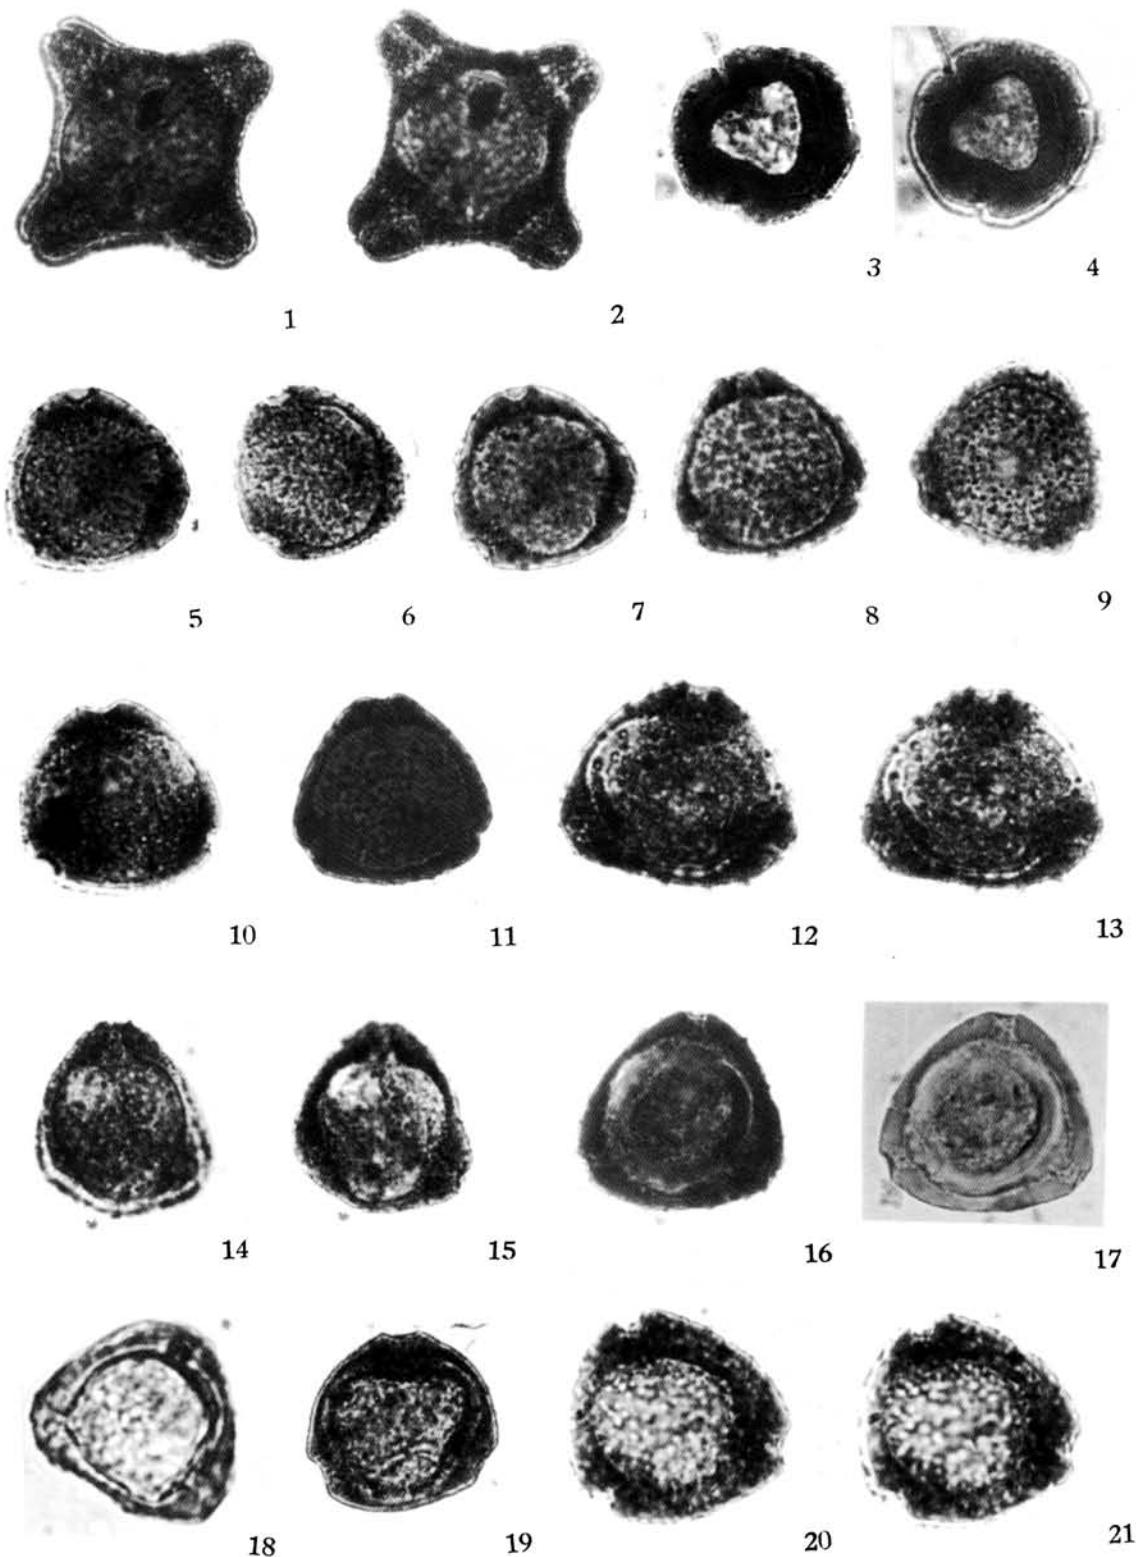

Occurrence: Same as the preceding species.

Type: Pl. 17, fig. 5; slide no.: San 1 (12-1-3)

**Spinotriporites pachydermus gen. et sp. nov.**

Pl. 17, figs. 14-18

Amb triangular to roundedly triangular, 22-30  $\mu\text{m}$  (holotype 24  $\mu\text{m}$ ) in diameter; triporate, pore round, pore canal index 0.3; exine 2-2.5  $\mu\text{m}$  thick, sexine 2-3 times thicker

Pl. 16. Figs. 1, 2. *Pseudotrudopollis basoides* sp. nov. Slide no: 687(19-1). Figs. 3, 4. *Romeinipollenites* cf. *laevigatus* Kedves et Herngreen 1980 Slide no.: 542(A-1). Figs. 5-11. *Spinotriporites unicannulatus* gen. et sp. nov. Slide no.: 523(4-2), 523(9-12), 523(9-2), 683(10-3). Figs. 12-15. *Spinotriporites biannulatus* gen. et sp. nov. Slides no.: 523(7-1), 523(7-2). Figs. 16-19. *Spinotriporites atriaporus* gen. et sp. nov. Slide no.: 683(A-5), 687(9-1), 523(3-1). Figs. 20, 21. *Spinotriporites annulatus* gen. et sp. nov. Slide no.: 681(2-1).

than nexine and gradually thickened to 4-5  $\mu\text{m}$  in pore area, without vestibula; microspinate, spinae about 1  $\mu\text{m}$  long, outline denticulate.

The new species differs from *S. unicannulatus* and *S. biannulatus* in its smaller size and very thick exine.

Occurrence: Same as the preceding species.

Type: Pl. 17, fig. 14; slide no.: 687(4-1)

**Spinotriporites microspinus gen. et sp. nov.**

Pl. 17, fig. 7

Amb roundedly triangular, diameter of holotype ca. 50  $\mu\text{m}$ ; triporate, pore with large exopore, ca. 7  $\mu\text{m}$  wide and atria in dark colour; exine ca. 1  $\mu\text{m}$  thick, sexine and nexine equally thick and without variations along pore margin; microspinate, spinae ca. 1  $\mu\text{m}$  long, well-distributed.

This new species is characterized by larger size, wide pore and thin exine, which distinguishes it from other species of this genus.

Occurrence: Same as the preceding species.

Type: Pl. 17 fig. 7; slide no.: 489(D-2)

**Spinotriporites tenuis gen. et sp. nov.**

Pl. 17, figs. 19-22

Amb roundedly triangular to circular, 35-40  $\mu\text{m}$  (holotype 35  $\mu\text{m}$ ) in diameter; triporate, pore round, ca. 6  $\mu\text{m}$  wide on type specimen; exine thin, under 1  $\mu\text{m}$  thick; microspinate, spinae commonly 1  $\mu\text{m}$  long, outline denticulate.

The new species is characterized by the thin exine.

Occurrence: Ya'an County, Sichuan, Yuguangpo Formation; Sanmenxia Area, Henan, Menli Formation.

Type: Pl. 17, fig. 19; slide no.: San 1(12-3-1)

## SPOROPOLLIS Pflug 1953

Type species: *Sporopollis documentum* Pflug 1953

**Sporopollis laqueaeformis** Weyland et Greifeld 1953

Pl. 18, figs 1-4

1953 *Sporopollis laqueaeformis* Weyland et Greifeld, S. 45, Taf. 13, Fig. 111, 112.

Amb triangular, diameter about 20  $\mu\text{m}$ .

Occurrence: Otog Banner, Inner Mongolia; Lower Tertiary.

**Sporopollis pseudosporites** (Pflug) Pflug 1953

Pl. 18, fig. 5

1953 *Sporopollis pseudosporites* Pflug, S 97, Taf. 25, Fig. 1-3.

Amb triangular, diameter about 25  $\mu\text{m}$ .

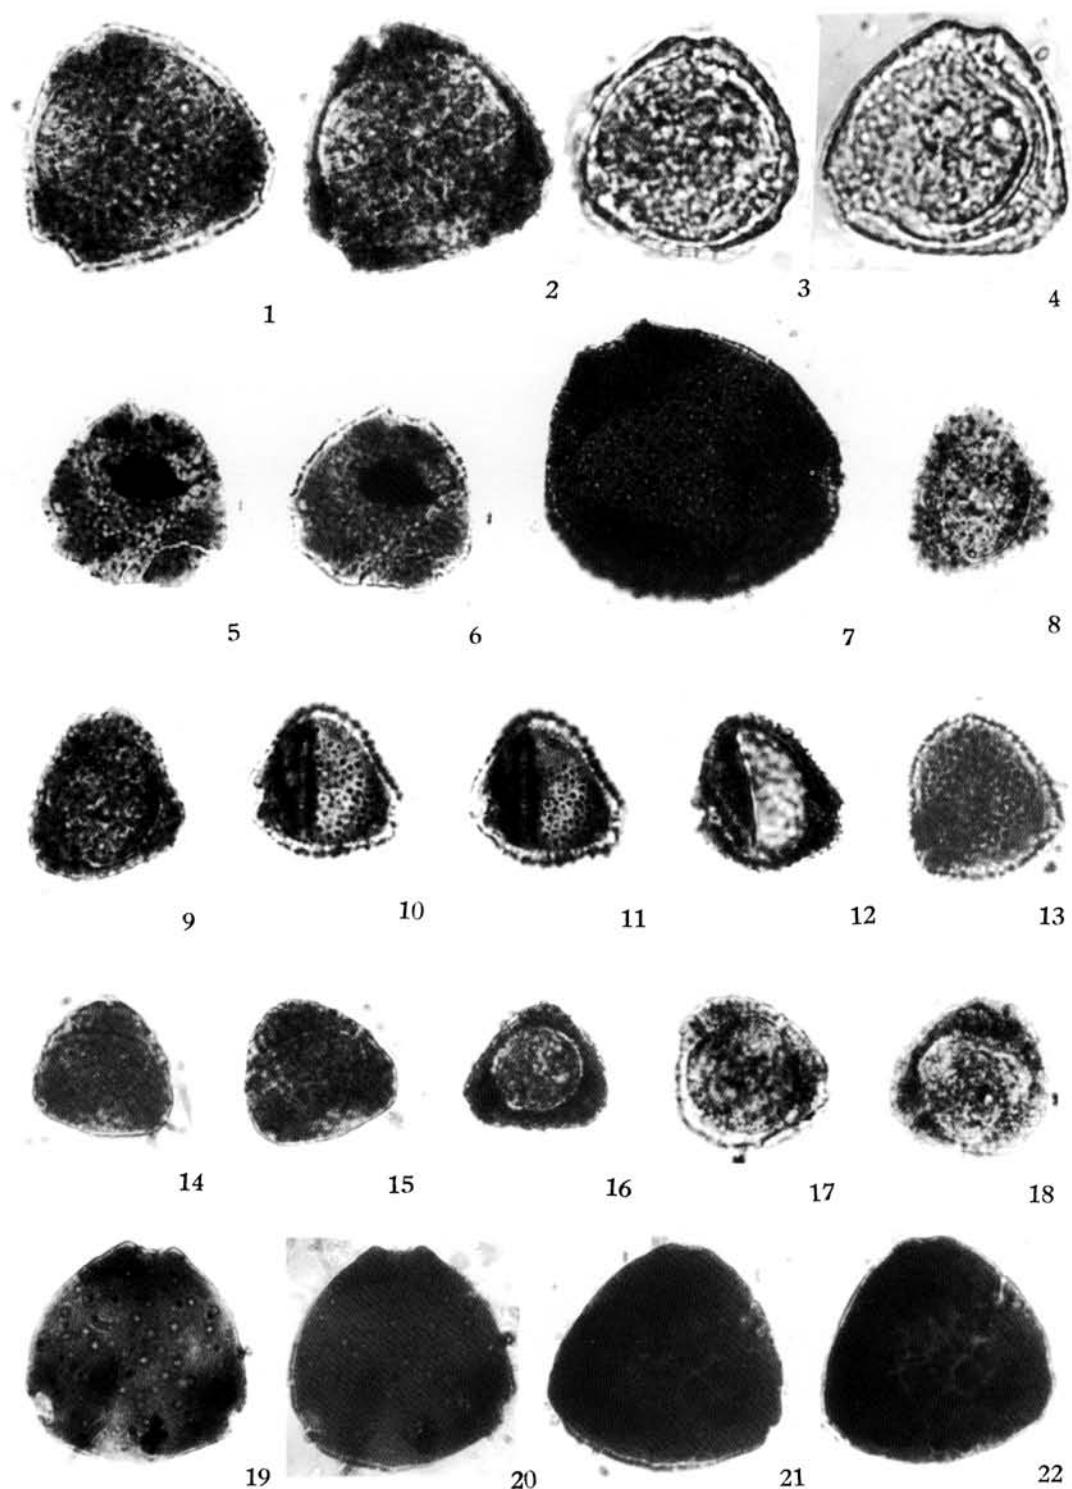

Occurrence: same as the preceding species.

**Sporopollis sp.**

Pl. 18, fig. 6-8

Amb triangular, diameter about 35  $\mu\text{m}$ .

Occurrence: same as the preceding species.

Pl. 17. Figs. 1-4. *Spinotriporites echinatus* (Sun et Zhang) gen. et sp. comb. nov. Slide no: 523(2-2), 460(3-2), 683(C-15). Figs. 5, 6. *Spinotrioprites intrannulatus* gen. et sp. nov. Slide no.: San I(12-1-3). Sanmemxia Area, Henan; Menli Formation. Fig. 7. *Spinotriporites microspinus* gen. et sp. nov. Slide no.: 489(D-2). Figs. 8-13. *Spinotriporites minor* (Wang, Sun et Zhao) gen. et sp. comb. nov. Slide no.: 683(C-1), 683(I-3), 681-11, 523(9-1). Figs. 14-18. *Spinotriporites pachydermus* gen. et sp. nov. Slide no.: 687(4-1), 523(19-1), 523(B-6). Figs. 19-22. *Spinotriporites tenuis* gen. et sp. nov. Slide no.: San I(12-3-1), San I(11-2). Sanmemxia Area, Henan; Menli Formation.

**SUBTRIAPERTURITES gen. nov**

Type species *Subtriaperturites tuberculatus gen. et sp. nov.*

**Diagnosis:** Pollen oblate to spherical, amb roundedly triangular to circular; triaperturate, subequatorial and angulaperturate, aperture composed of large atria and slit exogerminal; exine thin to moderately thick and thinning toward aperture; granulate, brevibaculate, rugulate and tuberculate.

**Remarks:** The new genus differs from *Subtrudopollis*, *Interpollis* Krutzsch 1961 and *Interporopollenites* Weyland et Krieger 1953 in its structure of aperture and ornamentation; the latter two genera have only with pore but no slit exogerminal, although the aperture is also situated subequatorially.

**Occurrence:** China, Early Tertiary.

**Subtriaperturites tuberculatus gen. et sp. nov.**

Pl. 18, figs. 9-12

1978 *Beaupreaidites verrucosus* Zhou, Geoscience Institute of Hubei Provience et al., p. 554, pl. 153, fig. 17.

1990 *Beaupreaidites aggregatus* Sun, Zhao et He, Wang et al., pl. 17, fig. 7.

Amb triangular to roundedly triangular, 20-25  $\mu\text{m}$  (holotype 22  $\mu\text{m}$ ) in diameter; triaperturate, subequato-angulaperturate, aperture composed of large atria and slit exogerminal pore, atria round, ca. 5  $\mu\text{m}$  wide; exine ca. 1  $\mu\text{m}$  thick and thinned in aperture area; tuberculate, tuberculæ large than 1  $\mu\text{m}$  in diameter and well distributed; outline microundulate, punctate in atria area.

**Occurrence:** Otog Banner, Inner Mongolia, Lower Tertiary.

**Type:** Pl. 18, fig. 11; slide no.: 479(A-6)

**SUBTRIPOROPOLLENITES Pflug et Thomson 1953**

**Type species:** *Subtriporopollenites annulatus notus* Pflug et Thomson 1953

**Subtriporopollenites firmus** Pflug 1953

Pl. 18, figs. 13, 14

1953 *Subtriporopollenites firmus* Pflug, S. 86, Taf. 9, Figs. 62, 63.

Amb nearly circular, diameter about 20  $\mu\text{m}$ .

**Occurrence:** Otog Banner, Inner Mongolia; Lower Tertiary.

**Subtriporopollenites tuberus** Sung et Lee, 1976

Pl. 18, figs. 15, 16

1976 *Subtriporopollenites tuberus* Sung et Lee, p. 36, pl. 7, figs. 30-38.

Amb triangular, diameter about 20  $\mu\text{m}$ .

**Occurrence:** Same as the preceding species.

**SUBTRUDOPOLLIS Krutzsch 1967**

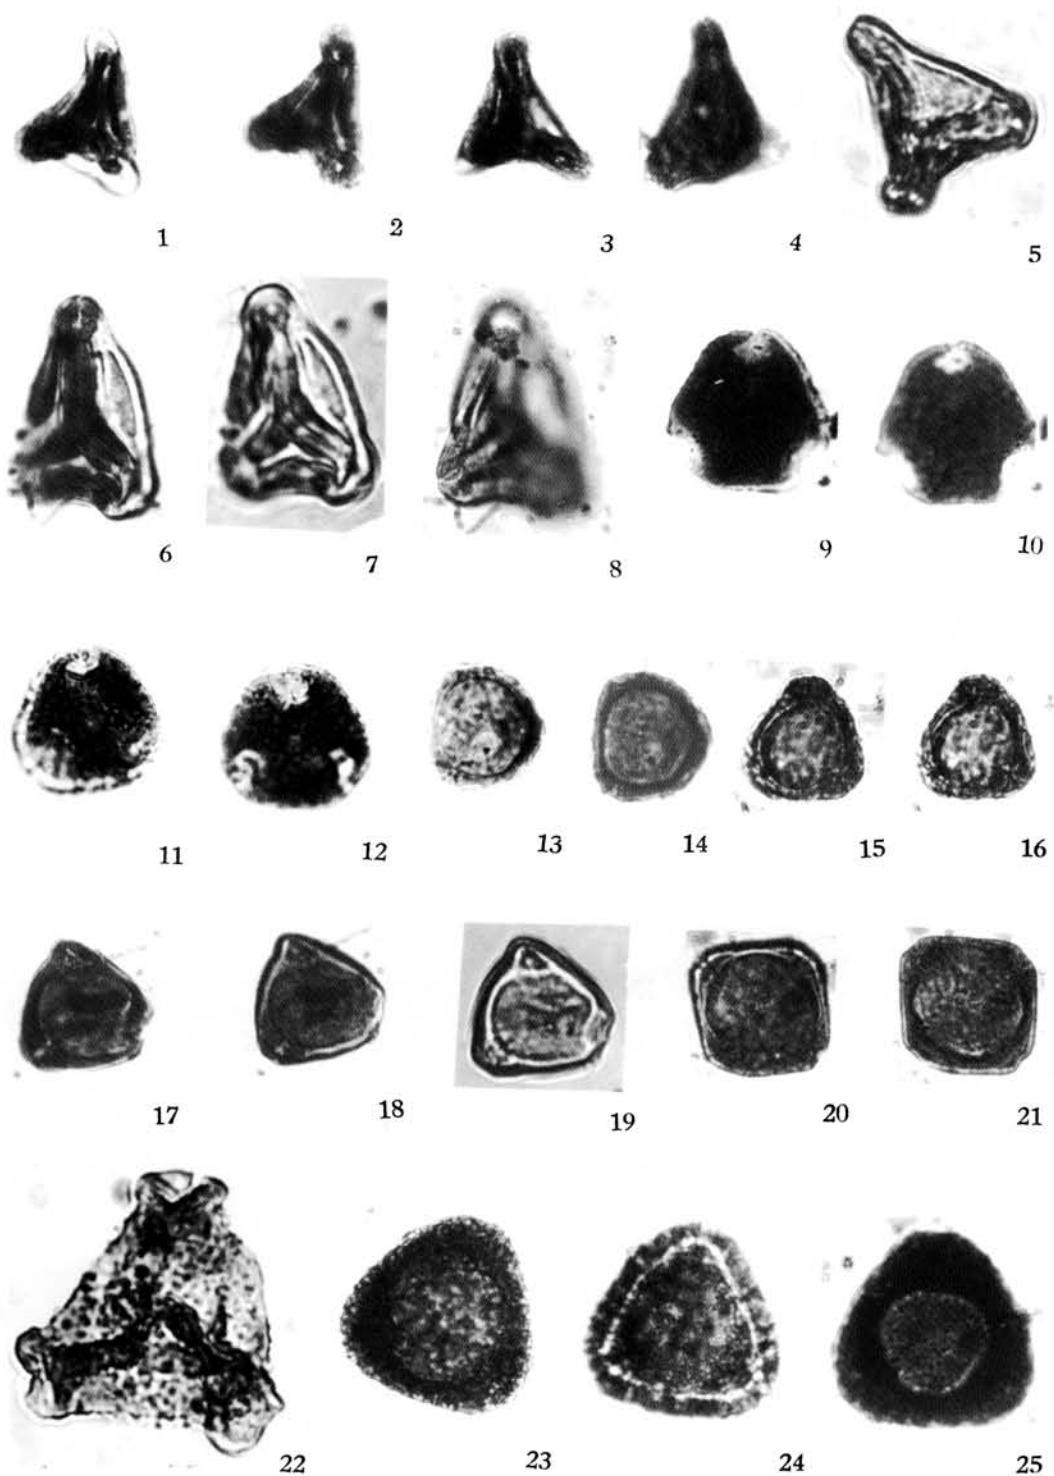

**Type species:** *Subtrudopollis subtrudens* (Pflug) Krutzsch 1967

**Subtrudopollis subtrudens** (Pflug) Krutzsch 1967

Pl. 18, figs. 17-19

1953 *Extratriporopollenites subtrudens* Pflug, S. 73, Taf. 6, Fig. 73.

1967 *Subtrudopollis subtrudens* (Pflug) Krutzsch, S. 506, Taf. 16, Fig. 41-47.

Pl. 18. Figs. 1-4. *Sporopollis laqueaeformis* Weyland et Greifeld 1953 Slide no.: 683(5-2), 683(A-9), 479(18-5). Fig. 5. *Sporopollis pseudosporites* (Pflug) Pflug 1953. Slide no.: 479(B-2). Figs. 6-8. *Sporopollis* sp. Slide no.: 683(C-2). Figs. 9-12. *Subtriatperturites tuberculatus* gen. et sp. nov. Slide no.: 687(5-2), 479(A-6). Figs. 13, 14. *Subtriporopollenites firmus* Pflug 1953. Slide no.: 687(10-6). Figs. 15, 16. *Subtriporopollenites tuberus* Sung et Lee 1976. Slide no.: 523(C-11). Figs. 17-19. *Subtrudopollis subtrudens* (Pflug) Krutzsch 1967. Slide no.: 479(B-1). Figs. 20, 21. *Tetrapollis validus* (Pflug) Pflug 1953. Slide no.: 522(A-2). Fig. 22. *Tantoupolis prominens* Wang, Sun et Zhao 1985. Slide no.: 308. North Jiangsu, Funing Group. Figs. 23-25. *Thomsonipollis magnificus* (Thomson et Pflug) Krutzsch 1960. Slide no.: 523(B-1).

Amb triangular, diameter about 20  $\mu\text{m}$ .

Occurrence: Otog Banner, Inner Mongolia; Lower Tertiary.

### **TANTOUPOLLIS** Wang, Sun *et* Zhao 1985

Type species: *Tantoupollis echinatus* Wang, Sun *et* Zhao 1985

#### **Tantoupollis prominens** Wang, Sun *et* Zhao 1985

Pl. 18, fig. 22

1985 *Tantoupollis prominens* Wang, Sun *et* Zhao, p. 119, pl. 1, figs. 6-8.

1993 *Corsinipollenites echinatus*, Qian *et al.*, p. 57, pl. 3, figs. 22, 25.

Amb triangular, diameter about 40  $\mu\text{m}$ .

Occurrence: North Jiangsu, Funging Group.

### **TETREPOLLIS** Pflug 1953

Type species: *Tetrepollis validus* (Pflug) Pflug 1953

#### **Tetrepollis validus** (Pflug) Pflug 1953

Pl. 18, figs. 20, 21

1953 *Tetrepollis validus* (Pflug) Pflug, S. 113, Taf. 24, figs. 72, 74, 76-79.

Amb tetrangular, diameter 22-25  $\mu\text{m}$ .

Occurrence: Otog Banner, Inner Mongolia; Lower Tertiary.

### **THOMSONIPOLLIS** Krutzsch 1960

Type species: *Thomsonipollis magnificus* (Thomson *et* Pflug) Krutzsch 1960

#### **Thomsonipollis magnificus** (Thomson *et* Pflug) Krutzsch 1960

Pl. 18, figs. 23-25

1953 *Intratriporopollenites magnificus* Thomson et Pflug, S. 88, Taf. 9, fig. 112.

1960 *Thomsonipollis magnificus*, Krutzsch, S. 58.

Amb triangular, diameter 30-35  $\mu\text{m}$ .

Occurrence: Otog Banner, Inner Mongolia; Lower Tertiary.

### **TREVISANAEPOLENITES** Kedves *et* Diniz, 1981

Type species *Trevisanepollenites triangulus* Kedves *et* Diniz, 1981

#### **Trevisanepollenites intrabaculatus** *sp. nov.*

Pl. 19, figs. 1, 2

Amb triangular with straight or slightly convex sides and rounded angles, diameter of holotype 35  $\mu\text{m}$ ; triporate, pore with large atria in triangular shape formed by sexine only, pore canal index nearly 0.3, exogerminal slit, symmetrical to equator; exine ca. 1.5  $\mu\text{m}$  thick, sexine thicker than nexine and slightly thickening to 1.5-2  $\mu\text{m}$  in proe area, with baculate

structure and clearer in pore area, inner side of sexine uneven; granulate, coarser in pore area, an unclear thickening shown on polar area.

The new species resembles the type species of this genus, *T. triangulus* Kedves et Diniz (1981, p. 25, pl. 2, figs. 79, 80) in the shape and structure, but the latter has a larger (40-50  $\mu\text{m}$ ) diameter and psilate ornamentation.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 19, fig. 2; slide no.: 687(3-3)

### TRIATRIOPOLLENITES Pflug, 1953

Type species *Triatriopollenites rurensis* Pflug, 1953

#### **Triatriopollenites furviatum Sun 1989**

P1. 19, figs. 3, 4

1989 *Triatriopollenites furviatum* Sun, p. 101, pl. 17, figs. 44-47.

Amb triangular or tetrangular, diameter 30-40  $\mu\text{m}$ .

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary; North Jiangsu, Funing Group.

#### **Triatriopollenites granulatus sp. nov.**

P1. 19, figs. 5-7

Amb triangular to roundedly triangular, 30-40  $\mu\text{m}$  (holotype 34  $\mu\text{m}$ ) in diameter; triporate, pore with clear atria; exine 1.5-2  $\mu\text{m}$  thick, sexine thicker than nexine extending to base of atria, and thickened inside in pore area to form club-shaped; granulate.

The new species which is characterized by strongly granulate ornamentation, resembles *Spinotriporites echinatus* in the shape and structure, but the latter differs in the echinate ornamentation only.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary; Sanmenxia Area, Henan, Menli Formation.

Type: Pl. 19, fig. 5; slide no.: 681(B-1)

#### **Triatriopollenites raribaculus sp. nov.**

P1. 19, figs. 8-10

Amb triangularly rounded, holotype 46  $\mu\text{m}$  in diameter; triporate, pore with atria; exine ca. 2  $\mu\text{m}$  thick, nexine thin and extending only to base of atria, sexine twice thicker than nexine and slightly thickened in pore area, with inner side uneven, denticulate or even dissolved to punctate structure; pore canal index under 0.3; exopore oval, ca. 8  $\mu\text{m}$  wide, endopore over 10  $\mu\text{m}$  wide; baculate, bacula commonly 1  $\mu\text{m}$  long and slightly expanded at terminal ends, sparsely distributed, with about 15-20 on outline, punctate in atria area.

The new species is characterized by its sparsely baculate ornamentation.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 19, fig. 8; slide no.: 476(A-1)

#### **Triatriopollenites roboratus Pflug 1953**

P1. 19, fig 11

1953 *Triatriopollenites roboratus* Pflug, S. 78, Taf. 7, fig. 71-74.

Amb triangular, diameter about 35  $\mu\text{m}$ .

Occurrence: Otog Banner, Inner Mongolia: Lower Tertiary.

**TRIMAGNAPORITES gen. nov.**

Type species *Trimagnaporites magnaporus gen. et sp. nov.*

**Diagnosis:** Pollen oblate, amb triangular or with concave sides; triporate, equato-angulaperturate, pore with large atria formed by sexine only, exopore commonly large, endopore relatively smaller than exopore, bearing no clear boundary with body; exine moderately thick, without clear thickening but with baculate structure in pore area; laevigate, granulate, microspinate and tuberculate.

**Remarks:** This new genus differs from *Concavitriporites* in the large atria, the exopore and endopore in the same size and the absence of thickening in pore area. It is similar to *Santonipollis* Groot, Krutzsch et Pacltova 1967 in the amb, large atria and ornamentation, but the latter differs in the slit exogerminal and clear thickening in pore area. It differs from *Oculosa* Blyakhova 1975, which has subequatorial aperture and strongly thickened exine in endopore.

Occurrence: China, Early Tertiary.

**Trimagnaporites magnaporus gen. et sp. nov**

P1. 19, figs. 12, 13

Amb triangular with concave sides and obtuse angles, 30-40  $\mu\text{m}$  (holotype 34  $\mu\text{m}$ ) in diameter; triporate, pore with large atria formed by sexine only, exopore ragged, 7-10  $\mu\text{m}$  wide, endopore smaller than exopore; exine 1.5-2  $\mu\text{m}$  thick, sexine thicker than nexine and slightly thickened in pore area, with inner side uneven, nexine extending to base of atria; granulate, grana sparsely distributed.

The new species is characterized by its ragged exopore.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.

Type: Pl. 19, fig. 12; slide no.: 687(10-2)

**Trimagnaporites tenuis gen. et sp. nov**

P1. 19, fig. 17

Amb triangular with concave sides and rounded angles, holotype ca. 40  $\mu\text{m}$  in diameter; triporate, pore with atria formed by sexine only, exopore oval, 5-7  $\mu\text{m}$  wide; exine under 1  $\mu\text{m}$  in thickness and slightly thickened to 1  $\mu\text{m}$  in pore area, with inner side uneven in pore area; granulate.

The new species is characterized by the thin exine.

Occurrence: Same as the preceding species.

Type: Pl. 19, fig. 17; slide no.: 479(6-2)

**Trimagnaporites triangulus gen. et sp. nov.**

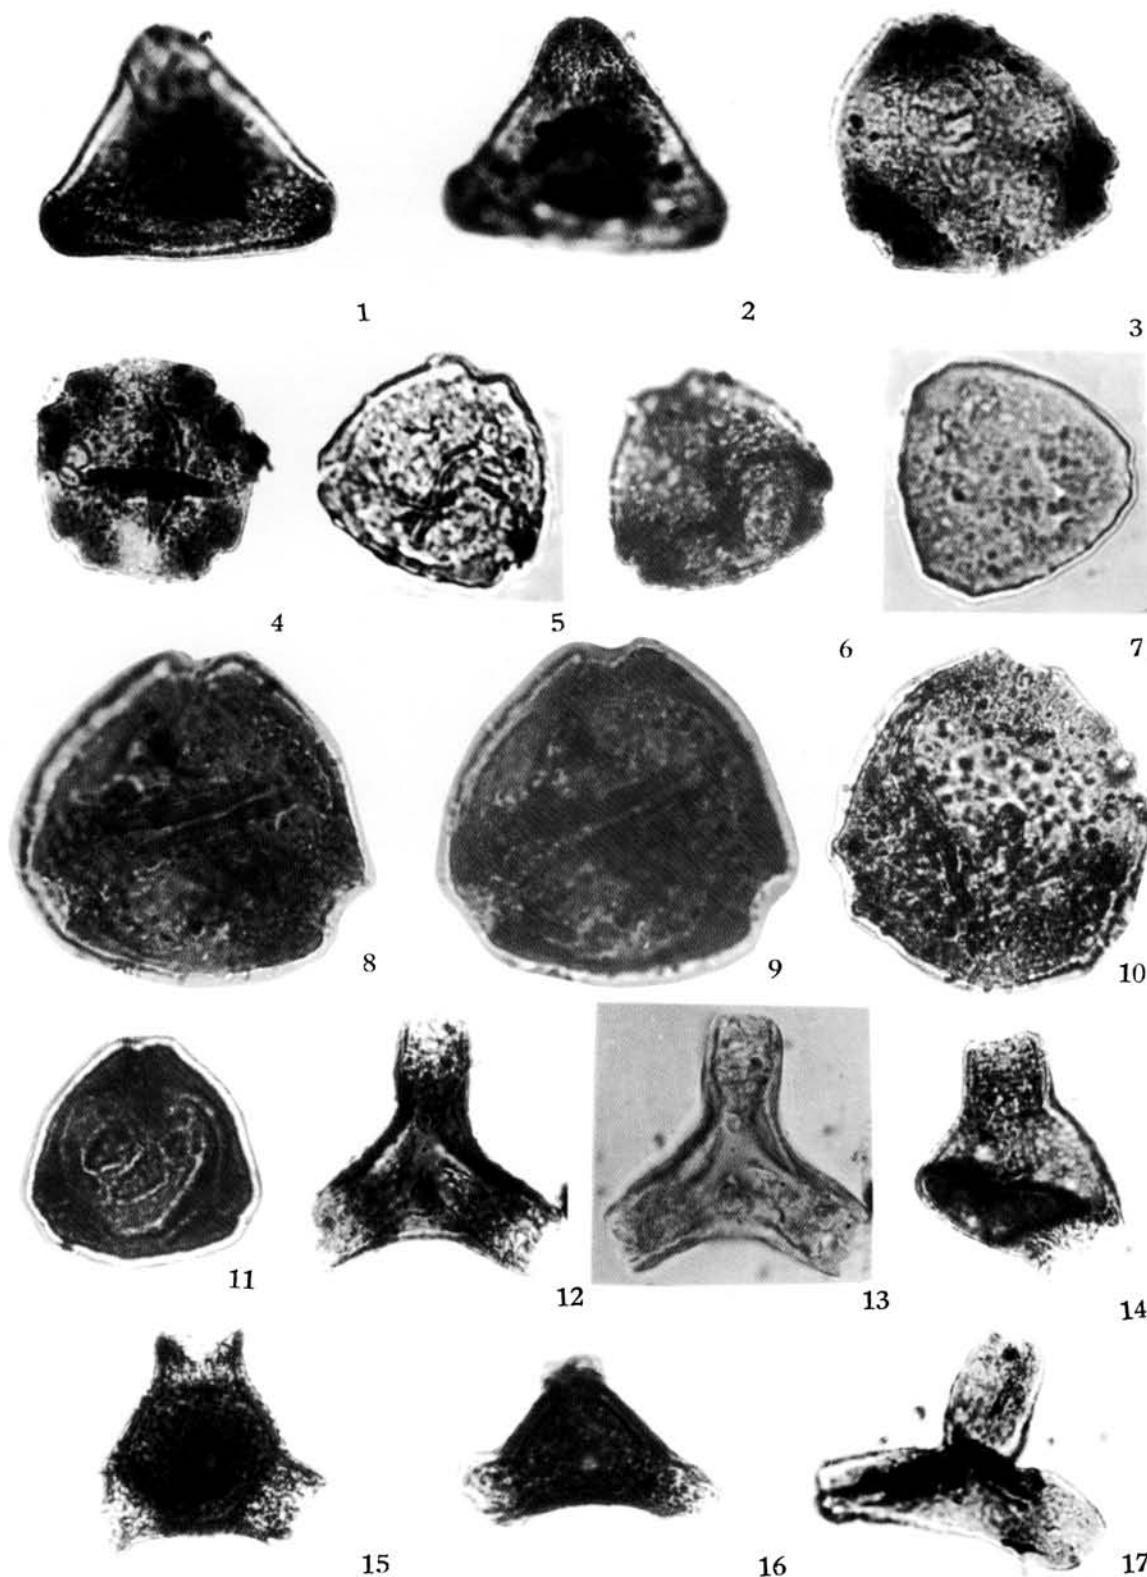

P1. 19, figs. 14-16

Amb triangular with straight or slightly concave / convex sides, diameter of holotype 30  $\mu\text{m}$ ; triporate, pore with large atria formed by protruded sexine in dome-shape, exopore smaller than endopore; exine 2-2.5  $\mu\text{m}$  thick, sexine twice thicker than nexine and with unclear baculate structure, inner side of sexine in pore area uneven, nexine extending to base of atria; scabrate to microgranulate.

The new species is characterized by the triangular amb and dome-shaped pore.

Occurrence: Same as the preceding species.

Type: Pl. 19, fig. 15; slide no.: 687(16-1)

Pl. 19. Figs. 1, 2. *Trevisanaepollenites intrabaculatus* sp. nov. Slide no.: 687(3-3). Figs. 3, 4. *Triatriopollenites furvatrium* Sun 1989. Slide no.: 523(2-1), 683(11-5). Figs. 5-7. *Triatriopollenites granulatus* sp. nov. Slide no.: 681(B-1), 683(17-5). Figs. 8-10. *Triatriopollenites raribaculus* sp. nov. Slide no.: 476(A-1), 683(A-8). Fig. 11. *Triatriopollenites roboratus* Pflug 1953. Slide no.: 683(13-2). Figs. 12, 13. *Trimagnaporites magnaporus* gen. et sp. nov. Slide no.: 687(10-2). Figs. 14-16. *Trimagnaporites triangulus* gen. et sp. nov. Slide no.: 687(12-5), 687(16-1), 523(8-1). Fig. 17. *Trimagnaporites tenuis* gen. et sp. nov. Slide no.: 479(6-2)

**Trimagnaporites mixis gen. et sp. nov.**

Pl. 20, figs. 1-4

Amb triangular with concave sides, angles elongated and terminal ends rounded, 40-55  $\mu\text{m}$  (holotype 45  $\mu\text{m}$ ) in diameter; triporate, pore with cylindrical atria formed by sexine only, exopore equal or smaller than endopore; exine 2-3  $\mu\text{m}$  thick, sexine with baculate structure several times thicker than nexine; scabrate to granulate.

The new species is characterized by the different widths of exopores in one specimen.

Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary; Sanmenxia Area, Henan, Menli Formation.

Type: Pl. 20, fig. 1; slide no.: 683(A-2)

**Trimagnaporites sp.**

Pl. 20, figs. 5, 6

Amb triangular with concave sides, about 35  $\mu\text{m}$  in diameter.

Occurrence: Otog Banner, Inner Mongolia; Lower Tertiary.

**TRIPOROPOLLENITES Pflug et Thomson, 1953**

Type species *Triporporopollenites coryloides* Pflug 1953

**Triporporopollenites tuberculatus sp. nov.**

Pl. 20, figs. 7-9

1981 *Proteacidites* sp. 3, Song *et al.*, p. 124, pl. 35, fig. 23.

Amb triangular with slightly convex sides and rounded angles, diameter of holotype *ca.* 40  $\mu\text{m}$ ; triporate, equato-angulaperturate, exopore oval, 4-7  $\mu\text{m}$  wide; exine *ca.* 1.5  $\mu\text{m}$  thick and gradually thickening to 2-3  $\mu\text{m}$  in proe area, tuberculate; with grana distributed among round tuberculae.

The new species is characterized by the tuberculate ornamentation and the rounded tuberculae.

Occurrence: Northern Jiangsu, Funing Group; Sanmenxia Area, Henan, Menli Formation.

Type: Pl. 20, fig. 7; slide no.: 313

**TRUDOPOLLIS Pflug 1953**

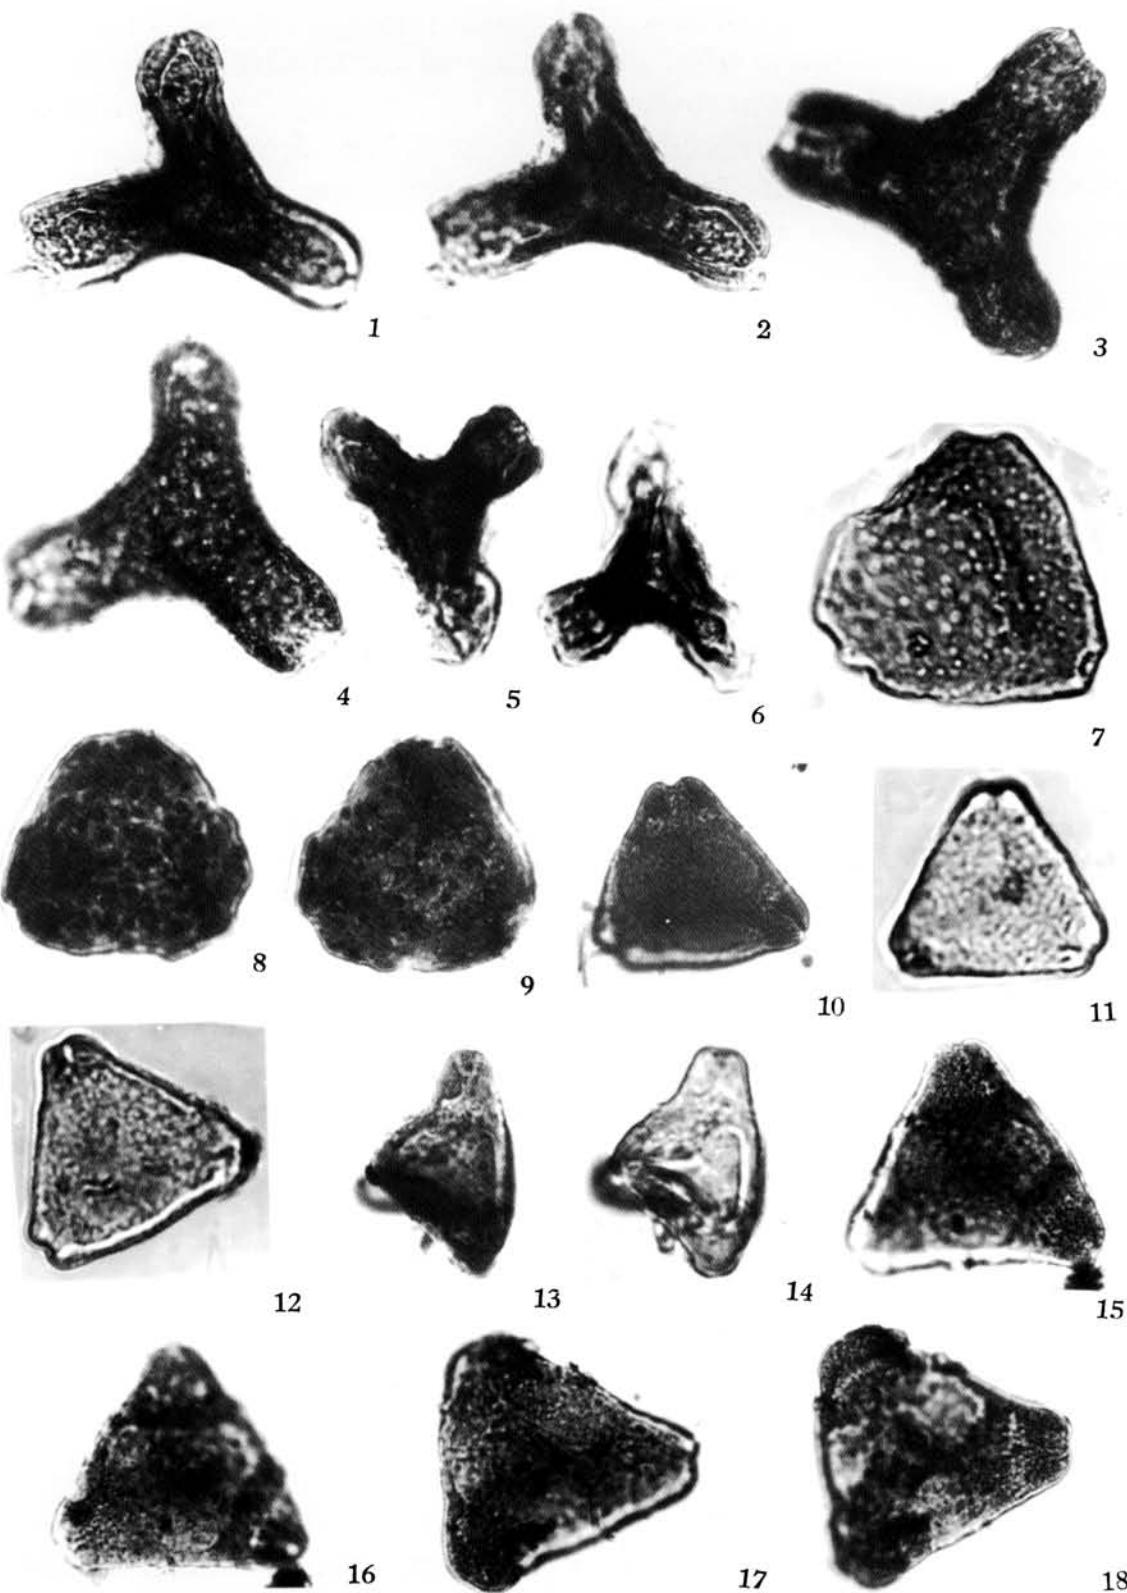

Type species: *Trudopollis pertrudens* (Pflug) Pflug 1953

**Trudopollis otogiensis sp. nov.**

Pl. 20, figs. 15-18

Amb triangular with straight or slightly concave sides and rounded angles, 30-40  $\mu\text{m}$  (holotype 35  $\mu\text{m}$ ) in diameter; triporate, pore with vestibula and unclear atria, vestibula oval, with inner side uneven, pore canal index over 0.3, exopore smaller than endopore, pore canal slit; exine 2-3  $\mu\text{m}$  thick, sexine twice thicker than nexine extending to base of atria, thickened at base of atria, and then becoming thinned and thickened again to 5  $\mu\text{m}$  along pore margin to form annulus; granulate, with punctate structure especially developed in pore area.

The new species is characterized by the sexine with punctate structure especially in pore area.

Pl. 20. Figs. 1-4. *Trimagnaporites mixis* gen. et sp. nov. Slide no: 683(A-2). Figs. 5, 6. *Trimagnaporites* sp. Slide no.: 683(C-4). Figs. 7-9. *Triporopollenites tuberculatus* sp. nov. Slide no.: 313, San 1(10-2). 7. North Jiangsu, Funging Group. 8, 9 Sanmemxia Area, Henan; Menli Formation. Figs. 10-12. *Trudopollis argutus* (Martynova) comb. nov. Slide no.: 683(4-4), 479(C-1), 479(B-6). Figs. 13, 14. *Trudopollis ordinatus* Zaslinskaya 1963. Slide no.: 478(A-5), 687(C-2). Figs. 15-18. *Trudopollis otogiensis* sp. nov. Slide no.: 479(7-1), 479(3-2).

- Occurrence: Otog Bannerr, Inner Mongolia; Lower Tertiary.  
 Type: pl. 20, fig. 16; slide no: 479(3-2)
- Trudopollis argutus** (Martynova) *comb. nov.* Pl. 20, figs. 10-12  
 1960 *Extratriporopollenites argutus* Martynova, p. 377, pl. 5, fig. 5.  
 Amb triangular, diameter 30-40  $\mu\text{m}$ .  
 Occurrence: Otog Banner, Inner Mongolia, Lower Tertiary.
- Trudopollis ordinatus** Zaklinskaya 1963 Pl. 20, figs. 13, 14  
 1963 *Trudopollis ordinatus* Zaklinskaya, p. 210, pl. 27, figs. 4, 5, 8.  
 Amb triangular, diameter 30-40  $\mu\text{m}$ .  
 Occurrence: Otog Banner, Inner Mongolia: Lower Tertiary.

## 中國早第三紀正型粉類及相關孢型(III)

宋之琛

(收稿日期：1995年10月25日；接受日期：1996年9月13日)

### 摘要

本文研究了中國一些地區古新統及下始新統的正型粉類及其相關的一些孢型。全文分三部份在 *Taiwania* 上發表。這是此文的第三部份，主要是孢型的分類學研究，共描述24屬和66種，其中包括9新屬，即：*Paleopachydermites*, *Parapeckipollis*, *Paraprenudopollis*, *Paratriangulipollis*, *Paravacuopollis*, *Pseudoproteacidites*, *Spinotriporites*, *Subtriaperturites* 和 *Trimagnaporites*, 10新組合和42新種。除註明產地者外，其它均產于內蒙古鄂托克旗草木浩石膏礦地層，時代為晚古新世至早始新世。

關鍵詞：早第三紀，正型粉類，中國。
