

Changes in the Flora on Islet Pengchiayu across 100 Years

Jer-Haur Li⁽¹⁾ and Wen-Liang Chiou^(2,3)

(Manuscript received 20 February, 2006; accepted 25 May, 2006)

ABSTRACT: In this study, we attempted to understand changes in the vascular plants of Isl. Pengchiayu, an islet in waters north of the main island of Taiwan. In addition to visiting the islet 3 times to survey the flora, documents regarding floral studies of Isl. Pengchiayu since 1906 and specimens of this islet deposited in 2 local herbaria, TAI and TAIF, were all referenced. Records of species on this islet were divided into 2 periods: the past (1904~1933) and recent (1992~2005) across about 100 years. All the vascular plants known to have existed during this period are listed. Results show that there were 144 species, including infraspecies, inhabiting the islet in the past period. Among them, 53 species have not been found recently. On the other hand, 39 species which apparently did not occur in the past have recently been recorded. In total, 130 species are known to exist on the islets recently. Possible reasons for the changes are also proposed.

KEY WORDS: Taiwan, Isl. Pengchiayu, Flora, Island biogeography.

INTRODUCTION

Isl. Pengchiayu (25°37'45" N, 122°04'30" E), called Hokasyo by the Japanese and Agincourt by the early British, is a small volcanic islet about 55 km north off the main island of Taiwan (Fig. 1). It has an area of 114.13 ha, and the highest point is 165 m in elevation. This islet is mainly surrounded by seashore cliffs, and above the cliffs, it is generally a rolling plain. Volcanic activities of this islet are thought to have occurred in the late Pleistocene to Holocene. The shoreline of the islet is being eroded by wave action especially in the east (Hayasaka, 1936; Chen, 1961; Lin and Chou, 1978). Vegetation on the islet is divided into 3 parts: seashore, cliff, and plain (Huang et al., 1992).

Settlement of Isl. Pengchiayu can be traced back to the middle of the 19th century. People are known to have immigrated here from the main island of Taiwan in 1853, and introduced some vegetables, crops, tobacco, and animals. They described some relics of much-earlier inhabitants. They moved back to Taiwan because of the war between China and France in 1884 (Chen, 1961; Wang, 1969). New inhabitants came in 1906, when a lighthouse, finished in 1909, was constructed (Anonymous, 1977). Only personnel maintaining the lighthouse and meteorological station and members of the Coast Guard live on the islet presently.

K. Ino was possibly the first explorer of the Japanese government to reach this islet in 1900 (Wang, 1969). T. Kawakami and U. Mori made the first floristic survey in September, 1904 (Kawakami, 1906). Thereafter the flora of this islet has been investigated several times (Kawakami, 1908; Yamamoto, 1939; Huang et al., 1992). Information of the flora on Isl. Pengchiayu can also be found in other documents which mainly used previous data, either from earlier publications or herbarium specimens, without carrying out any further investigations (e.g., Sasaki, 1930; Suzuki, 1937; Liu and Yang, 1974).

Species on islands reach an equilibrium at a certain species number when immigration and extinct rates achieve similar rates. However, human activity can possibly shift the equilibrium to a new level (MacArthur and Wilson, 1967). To understand the immigration and extinction of plants of Isl. Pengchiayu, we carried out 3 surveys during 2004 and 2005 and collected all known data from previous documents and specimens of TAI and TAIF, the 2 largest and oldest herbaria in Taiwan. Differences between the 2 periods, before World War II and the most recent 2 decades were compared. Species which had disappeared and those newly recorded were extracted, and possible reasons for these occurrences are discussed.

MATERIALS AND METHODS

To compare the floral differences between the past period (before World War II) and the recent period (the last 2 decades), floral records were

1. Herbarium, Institute of Ecology and Evolutionary Biology, National Taiwan University, 1, Roosevelt Rd., Sec. 4, Taipei 106, Taiwan.

2. Division of Forest Biology, Taiwan Forestry Research Institute, 53, Nanhai Rd., Taipei 100, Taiwan.

3. Corresponding author. Email: chiou@tfri.gov.tw

Fig. 1. The map of Isl. Pengchiayu.

grouped into 2 periods, 1904~1933 and 1992~2005. Floral comparisons were based on (1) records in previous reports, (2) specimens in the herbaria TAI and TAIF, and (3) our investigations for this study in 2004~2005. In addition to TAI and TAIF, we did not survey specimens of other herbaria in Taiwan, because they were all built after World War II and almost no collections from the past period were found.

RESULTS AND DISCUSSION

On Isl. Pengchiayu, totally 183 vascular plants have been recorded since the beginning of the 20th century. Among them, 144 and 130 species (including infraspecies) are known from before World War II (past) and after 1992 (recent), respectively. In comparing these 2 periods, 53 (36.81%) species from the past were not seen in the most-recent surveys, and 39 (27.08% of the past species number) recently recorded species had not been recorded before (Appendix). The most species-rich families are the Compositae and

Gramineae in both the past and recent periods (Table 1), which are the same results of Kawakami (1906), Yamamoto (1939), and Huang et al. (1992). Other families had much fewer species than these 2 families.

Table 1. Families with more than 5 species on Isl. Pengchiayu.

Family	Past (1904~1933)	Recent (1992~2005)	Total
Compositae	21	26	33
Gramineae	21	16	25
Leguminosae	5	8	9
Cyperaceae	8	5	8
Convolvulaceae	6	4	6
Euphorbiaceae	5	3	6
Verbenaceae	5	4	5
Solanaceae	5	1	5

The disappearance and appearance of plants during different periods might somehow have been caused by habitat changes or human activities. For example, the disappearances of *Centaureum japonicum*, *Sesuvium portulacastrum*, and *Evolvulus alsinoides* are possibly due to a reduction in the sandy-soil habitats; the disappearances of *Ranunculus sceleratus* and *Bacopa monnieri* are possibly related to the loss of wetland areas.

There was a "small woodland" described on the islet before (Kawakami, 1906; Yamamoto, 1939). It no longer exists, and the uplands are almost all covered by a *Miscanthus* grassland with a few trees, such as genera *Ficus*, *Morus*, *Callicarpa*, etc., in small groves or standing alone. This might explain the disappearance of some woody plants, such as *Ficus nervosa*, *Flueggea suffruticosa*, *Diospyros ferrea*, *Syzygium taiwanicum*, and *Hibiscus syriacus*. A slightly higher proportion at 44.44% (8 of 18) of woody species disappeared, compared to herbs at 35.71% (45 of 126). On the contrary, only 1 woody species, *Pittosporum tobira*, is newly recorded, and it is only sparsely distributed.

Assuming that Isl. Pengchiayu and the main island of Taiwan belong to the same biogeographic region, 11 of 39 (28.21%) newly recorded species are naturalized plants (defined by Wu et al., 2004) and all of them are herbaceous, such as *Erechtites hieracifolia* and *Ageratum conyzoides*. Other newly recorded species have also been discovered on the northern coast of the main island of Taiwan. The naturalized plants in these two periods arose from 9.03% (13 of 144) to 12.31% (16 of 130). Those newly recorded naturalized plants on Isl. Pengchiayu were mostly found in areas of human habitation. Obviously, human activity significantly affects the spread and inhabitation of plants.

On the other hand, many earlier naturalized plants have now apparently disappeared. Some

plants, probably introduced by earlier settlers for vegetables, medicinal purposes, or handicrafts such as *Xanthium strumarium*, *Nicotiana tabacum*, *Ricinus communis*, *Vigna sesquipedalis*, etc., were not found either. There is little information on their immigration, naturally or artificially. However, such plants could have adapted to this islet in a relatively short time.

The composition of the flora of this islet before any human activities is unknown. Kawakami (1906) recorded 71 species of vascular plants in 1904 after the settlers had been off the islet for around 20 years. The species number is about 1/2 of that reported by Yamamoto (1939). Many of those species occurring after Kawakami's investigation were weeds, such as *Cyclosorus acuminatus*, *Alternanthera sessilis*, *Stellaria aquatica*, *Chenopodium album*, *Conyza canadensis*, *Pterocypsela indica*, *Youngia japonica*, *Hypericum japonicum*, *Alysicarpus vaginalis*, *Desmodium heterophyllum*, *Solanum americanum*, and *Poa annua*. Human activities and traffic between Taiwan and Isl. Pengchiayu are probably the main reasons for the immigration and spread of those weeds on this islet because the construction of the lighthouse began in 1906, and residents have inhabited the islet since that time.

Kawakami (1906) and Huang et al. (1992) both noted some human-planted species, but produced no voucher specimens. During our investigation, such vegetable or ornamental plants were also found. However, we did not include them in this study because they were restricted to the areas where humans lived and had not yet escaped into the wild gene pool.

A few (24) species recorded before World War II without voucher specimens were also included in this study. This may have caused somewhat discrepant results. However, information gained from this study is significant for long-term monitoring which is fundamental for research of floral fluctuations and vegetative succession.

ACKNOWLEDGEMENTS

We greatly thank Mr. Cing-Cai Lin, the director of the Meteorological Station of Isl. Pengchiayu, and Mr. Wun-Fa Bo, director of the Lighthouse of Isl. Pengchiayu, for their assistance on our survey trips; Ho-Ming Chang, Chien-Wen Chen, Shih-Wen Chung, Sheng-Yuan Hsu, Yao-Moan Huang, Chiao-Yu Kuo, Pi-Fong Lu, Shan-Jye Moore, and Chih-Jiun Wang for their help with collections and flora surveys; Ho-Ming Chang, Shih-Wen Chung,

Mei-Fang Kao, Chang-Sheng Kuoh, Wai-Chao Leong, Yea-Chen Liu, and Ching-I Peng for their useful comments or assistance with plant identification. The herbaria TAI and TAIF which provided specimens for this study are highly appreciated. This study was funded by a grant from the Taiwan Forestry Research Institute.

Appendix. Checklist of the flora of Isl. Pengchiayu. Years following the plant names represent the year of published documents, i.e., Kawakami (1906, 1908), Suzuki (1937), Yamamoto (1939), Liu & Yang (1974), and Huang et al. (1992). The "No." column represents the species order; ⁿ⁾ and ^{w)} represent naturalized (based on the flora of Taiwan mainly according to Wu et al. 2004) and woody plant, respectively. The "P" column represents species appearing in the past (before WWII), and the "R" column represents species appearing recently (after 1992). Meanings of abbreviation in the "cited specimens" column: K & M: T. Kawakami & U. Mori (K or M alone means only one collector was described on the label), May 1907, deposited at TAIF if not especially noted; Ki: Y. Kikuchi, January 1913, deposited at TAIF; Y: Y. Yamamoto et al., August 1933, deposited at TAI; H: T. C. Huang et al., August 1992, deposited at TAI; L: J. H. Li (et al.), October 2004 (1075~1129), June 2005 (1187~1263) and October 2005 (1311~1319), deposited at TAI; C: S. W. Chung (et al.), October 2004 (7638~7678) and June 2005 (7733~7802), deposited at TAIF; Lu: P. F. Lu (et al.), June 2005 (9810~9856), deposited at TAIF. The accession numbers of the herbarium were added to those specimens without a collection number. All specimens cited in Yamamoto (1939), Huang et al. (1992) and collection records in Sasaki (1930) are listed, but brackets were added if they were not found in the herbarium.

Unknown Species					
		<i>Cyperus</i> sp.: 1906; 1992.			
		<i>Panicum</i> sp.: 1908.			

¹⁾ Yamamoto (1939) cited specimens Y 4 and Y 5 as both *Neottpteris rigida* (*Asplenium nidus*) and *Cyclosorus acuminata* (*Cyclosorus acuminatus*). The former was mis-cited.

²⁾ The collection number 15775 cited by Huang et al. (1992) has been anonymously changed to 15755 on the label.

³⁾ The collection number 15782 cited by Huang et al. (1992) has been anonymously changed to 15785 on the label.

⁴⁾ The collection number 15776 cited by Huang et al. (1992) has been anonymously changed to 15796 on the label.

⁵⁾ Yamamoto (1939) recorded this species without voucher specimens which were found later.

⁶⁾ Huang (1992) erroneously cited it as 15769, which should have been *Vigna minima* var. *minima*.

彭佳嶼近百年來的植物相變化

李哲豪⁽¹⁾、邱文良^(2,3)

(收稿日期：2006 年 2 月 20 日；接受日期：2006 年 5 月 25 日)

摘 要

為了解彭佳嶼上的維管束植物種類的變化情形，作者三度前往彭佳嶼採集植物，並整合自 1906 年以來的名錄、相關文章等，同時查閱存放在臺灣大學植物標本館 (TAI) 與臺灣林業試驗所標本館 (TAIF) 內的標本。島上植物種類之記錄被區分為昔日 (1904~1933) 與今時 (1992~2005) 兩部分，時間幅度長約百年。比對並列表該小島在這段時期曾存在的植物種類，結果確認昔日存在的 144 種中，有 53 種消失，但另新增 39 種，目前島上存有 130 種。文中對這些種類變化提出可能的原因。

關鍵詞：臺灣、彭佳嶼、植物誌、島嶼生物地理。
