(Manuscript received 20 December 2009; accepted 2 March 2010)

**ABSTRACT:** Naturalized flora of Taiwan has been increasing in the past six after the first catalogue was compiled in 2002. In order to probe into the increasing pattern behind this dramatic growth of potential invaders, we compiled and evaluated newly added naturalized species in a quest for better understanding. Furthermore, naturalized species shared with neighboring regions, such as Mainland China and Japan, were estimated as well. The results revealed that two-thirds of these newly recruited species naturalized before 2002, and only 77 actually naturalized after 2002. The proportion of naturalized flora in the native species pool increased from 8% to 12%. The compositions, origins, and life forms of these potential invaders before and after 2002 were similar with slight fluctuations presented in the ranks of the dominant families. Number of species shared with neighboring regions multiplied due to the fast growth of the naturalized flora in Taiwan; nevertheless, the number might be understated due to the inaccessibility of the latest naturalized floras from neighboring regions. The doubled flora of naturalized species in the past six years implies insufficient attention to plant invasions and lag phases of invasion. The expansion of naturalized flora in Taiwan also increased the pools of naturalized species shared with neighboring areas, including Mainland China and Japan.

**KEY WORDS:** Flora, naturalized species, plant invasion, Taiwan.

## INTRODUCTION

Plant invasions are considered one of the most serious environmental threats to local ecosystems and biodiversity (D'Antonio and Hobbie, 2005; Mooney, 2005; Stachowicz and Tilman, 2005). Although composition of plant invasions have been studied in many regions (Meiners, 2007; McClain and Ebinger, 2008; Murphy et al., 2008), the results usually reflect small-scale fluctuations of local vegetation. The dynamics of naturalized/invasive flora, which demonstrate the overall pattern, vicissitude, and susceptibility of potential invaders, are seldom discussed, especially in regions experiencing escalating international trade.

To study the patterns of plant invasions, naturalized plants are often employed since naturalization implies successful reproduction and dispersal in newly colonized territories (Rejmánek and Richardson, 1996; Richardson et al., 2000; Daehler, 2001; Pyšek et al., 2002; Wu et al., 2003; Lake and Leishman, 2004; Pyšek et al., 2004). In Taiwan, the patterns of naturalized flora were first compiled and examined in 2002 (Wu et al., 2004a, b); however, the naturalized flora has subsequently almost doubled during the past six years (Chen et al., 2004, 2005, 2006, 2007; Hsu et al., 2004, 2005, 2006; Jung et al., 2005, 2006, 2008). This remarkable number of recent naturalizations, approximately 50 species per year, seemed to imply escalating plant invasions in Taiwan.

Several hypotheses have been proposed to account for the naturalization preferences of introduced species, including similar climates (Corlett, 1988, 1992) and distant phylogeny (Darwin, 1859; Rejmánek, 1998). Accordingly, particular patterns of naturalized floras might be present in regions circumstantially. In Taiwan, naturalized species have mainly originated from the Americas, especially its tropical regions, which approximate the tropical weather in southern Taiwan. Besides, the dominant genera of naturalized flora were considered as coming from tropical, warm or temperate regions as well. Although the most naturalized families were simply the largest families of the world, several important families of the naturalized flora in Taiwan were tropical families, such as Amaranthaceae (Wu et al., 2004a). Therefore, we assumed that the composition of newly added naturalized members might present an analogous formation.

The main purpose of this study was to re-evaluate the current pattern of plant invasions in Taiwan by comparing the naturalized flora before and after the year 2002, to better understand the dynamics of potential invaders in the past six years. Furthermore, we also sought to establish firm knowledge of potential invaders in Taiwan to take strict precautions against the booming connections with Mainland China slated to begin from the summer of 2008.

## MATERIALS AND METHODS

### Study area

Taiwan, a west Pacific Rim island straddling the Tropic of Cancer, experiences subtropical weather in the north and a tropical climate in the south. Annual temperatures average 22° C to 25° C, and annual precipitation average is 3,000 mm (Hsieh, 2002). Taiwan proper has an area of 35,800 km<sup>2</sup>, two-thirds of which are mountainous with numerous hills and peaks of 500 to 3,952 m. The western plains, 0 - 300 m in elevation, make up the rest of the island and accommodate most of the human population. Dramatic topographical differences, combined with diverse various climates from lowland tropical to alpine, result in a high diversity of habitats. Currently, about 50% of the island is covered by coniferous and broadleaf forests. A total of 4,216 native and naturalized species, belonging to 1,389 genera and 233 families, had been reported from Taiwan up to the year 2002. The majority of these species (2,776) are herbaceous, followed by trees (588), shrubs (426), lianas (248), and vines (177) (Hsieh, 2002). Of all native species, about 1,041 are endemic to Taiwan. Asteraceae and Poaceae are among the families that contribute the most to the endemic flora.

### Naturalized Species

Two major sources of information on species naturalization were employed in our study: documents and personal field observations. Based on our previous compilation of naturalized flora (Wu et al. 2004b), we reviewed all of the available journal articles, government documents, and publications released after 2002 to update the list. All species exotic to Taiwan, with each species designated as naturalized, escaped or persistent after cultivation, or invasive, were compiled. Species introduced or cultivated without any evidence of being escaped were not considered. Herbarium records were reviewed to verify the naturalization status of introduced species sighted in the field without any documentation. Three main herbaria in Taiwan (HAST, TAI and TAIF), as well as a university herbarium, (NCKU), were visited, and voucher information on the specimen labels of specimens of naturalized species was examined, including locality and year of collection. Each naturalized species was listed alongside a referable document, either a journal article or a specimen (Appendix 1). Species mentioned in informal/nonacademic literatures as naturalized or escaped were considered suspiciously naturalized and were not included if further proof of naturalization was not available.

### Species information

For each naturalized and species suspected to be naturalized, we obtained and compiled its life history traits, such as habit and life form in the Raunkiaer system

(Mueller-Dombois and Ellenberg, 1974), origin, year of the first record, from publications or reliable Internet databases, e.g. ISSG (<http://www.issg.org/>), and E-flora (<http://www.efloras.org/index.aspx>). The year of the first record referred to its first herbarium record or first documentation. Species reported after 2002 with specimen records before 2002 were categorized as intermediate species. Although the major herbaria in Taiwan accommodate about half a million specimens, the earliest specimens might not be available for every species. Therefore, only species with clear records were employed for further analyses.

### Analysis

Information on naturalized species' taxonomic distribution, native areas, life forms, habits, year of the first available records, mode or purposes of introduction, and invasion status in Taiwan, was compiled for comparisons and further analyses. Weed lists for China and Japan, the nearest continental and island regions, were obtained from Wu et al., (in press) and The Weed Science Society of Japan ([www.wssi.jp](http://www.wssi.jp)), to predict potential weeds shared by these regions. Species accumulation was plotted against the year (1957-2008).

## RESULTS

Naturalized species increased 74% from 2002 to 2008; but only 77 species were actually naturalized after 2002 (Table 1). Among these additional naturalized species, 182 (70%) were intermediate species with herbarium records dated before 2002, but documented after 2002. The above-mentioned 77 species in 32 genera and four families resulted in a naturalization rate of 12.8 species per year in the past six years (2002-2008), an approximately 3.47-fold increase over the pre-2002 period (3.68 species/year). The average naturalization rate in the past 150 years (1860 to 2008) was 4.05 species per year. These new additions to the naturalized flora in Taiwan were mainly chameophyte, followed by therophyte and cryptophytes.

The dominant families and genera of the intermediate species and of species naturalized after 2002 were very similar; however, the ranks of major contributing families of the current naturalized flora changed (Figs. 1 & 2). Among the new members of the naturalized flora, Poaceae was the most dominant family, followed by Fabaceae, Asteraceae, Acanthaceae and Euphorbiaceae. *Cyperus* and *Acmella* were the dominant genera, followed by *Bromus*, *Amaranthus*, and *Ipomoea*. As for the updated naturalized flora of Taiwan, Poaceae (81 species) replaced Fabaceae as the most dominant family, followed by Fabaceae (79 species), Asteraceae (74 species), Solanaceae (29 species), and Convolvulaceae

**Table 1. Numerical summary of naturalized plants species in Taiwan by taxonomic level and life-forms of Raunkiaer system.**

	Naturalized before 2002			Intermediate			Naturalized after 2002			total

(22 species). Additionally, the list of dominant genera remain unchanged over recent years, with most dominant genus still being *Ipomoea*, followed by *Solanum*, *Amaranthus*, *Croralaria*, and *Paspalum*. As for the origins of the naturalized species, America was the largest contributor of species naturalized before and after 2002, followed by Asia and Europe (Fig. 3).

The naturalized floras before and after year 2002 were mainly composed of newly naturalized genera. For intermediate species, 61.5% of the genera and 25% of the families were new to Taiwan. On the other hand, 62.5% of genera naturalized after 2002 and 25% of the families were new to Taiwan.

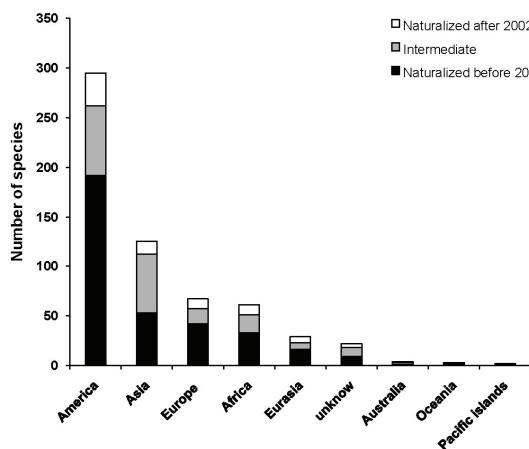

Current naturalized flora shared by Taiwan and neighboring countries increased dramatically as well (Fig. 4). Species shared by Taiwan and Japan increased about six times, and species shared by Taiwan and China rose about 7.8 times. Species shared by China and Japan also doubled. The naturalized species shared by these three regions rose about fourfold, from 27 species to 109 (Fig. 4).

## DISCUSSION

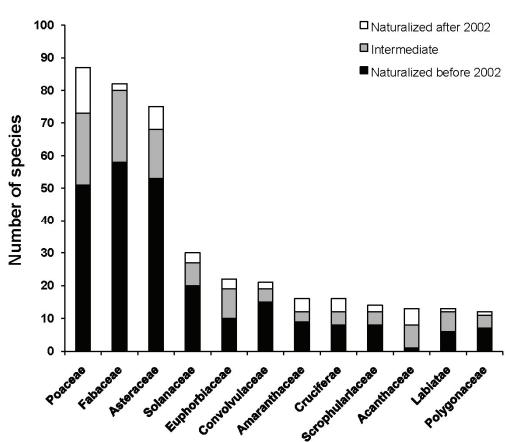

The explosive increase of naturalized flora between 2002 and 2008 gave rise to a false alarm of deteriorating plant invasions in Taiwan after that country's entry into the WTO, since most of these new members had been naturalized before 2002 (Table 1). Two things may account for the delayed appearance of numerous

intermediate species in herbarium records dated before 2002, insufficient taxonomical efforts and a recent outbreak of plant invasions. However, the latter might have been far more influential than the former. Plant systematics is a fully developed field in Taiwan, and specimens are preserved under well organized herbarium systems. The chance that these species could escape the frequent and deliberate collection activities routinely implemented by numerous taxonomists and amateurs is small. However, it is still possible that identification difficulties delayed the documentation process, since Poaceae and Asteraceae, two taxonomically difficult families, were the major contributors to these new members of naturalized flora. Significant increases of Poaceae might be a result of recent identification efforts, since many of them were collected before the year 2000 and not well identified. These species might have experienced lag phases of different lengths in the past years before finally breaking out and receiving attention (Crooks and Soule, 2001). It is not known if fast growing international trade has shortened the lag phases of these intermediate species; nevertheless, the construction and domestic transportation accompanies a booming local economy might be underlining driving forces.

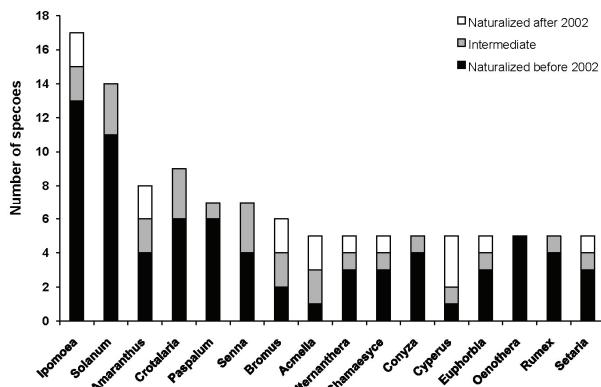

The naturalized species shared by any two of the three adjacent regions, Taiwan, Mainland China, and Japan, have multiplied (Fig. 4). The number of species shared between Taiwan and mainland China almost equals the number of invasive species recently reported

**Fig. 1.** The origins of naturalized floras before and after year 2002. Intermediate species indicated the species reported after 2002 with archived in major herbaria before year 2002.

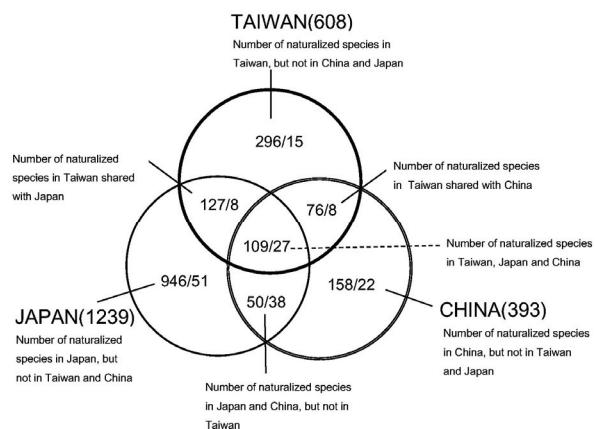

**Fig. 2.** The dominant families of naturalized floras before and after year 2002. Intermediate species indicated the species reported after 2002 with archived in major herbaria before year 2002.

by China ((Ding et al., 2008; Liu et al., 2006; Weber and Li, 2008). As the half-century long prohibition of direct transportation across the Taiwan Strait comes to an end, the warming of relations between Taiwan and China will inevitably lead to increased plant invasions. Long monitoring and detailed reports of naturalized floras from the neighboring regions are in urgent demand.

Compared to our first compilation (Wu et al., 2004a), Poaceae, Fabaceae, and Asteraceae, the most dominant families changed only in rankings and were still the three largest families in the world. Interestingly, the most dominant genera remained unchanged. In addition, the fact that the life forms and origins of the new members of naturalized species were identical with those of the first compilation confirmed that the environments and climates in Taiwan favored certain groups of introduced plants. Nevertheless, the fast

**Fig. 4.** A Venn diagram showing the overlap of the sets of naturalized species in and shared by Taiwan, China, and Japan.

growth of a few relatively neglected genera, such as *Cyperus*, *Acmella* and *Bromus*, have provided another perspective of potential invaders. *Cyperus* species were usually found in wetlands and river banks, the ecosystems of which were relatively obscure and poorly studied. On the other hand, *Bromus* species usually occur in montane nature reserves inhabited by many endemic and rare species in Taiwan (Wu et al., unpublished). Although they were still minorities compared to other big genera, their growth implied insufficient taxonomic attention to taxa difficult to identify. Moreover, their importance could be underestimated.

Although we have observed the expansion of naturalized flora, it is still very difficult to propose a list of suspicious invaders which deserve immediate attention without solid field data. Likewise, a scarcity of similar works carried out by neighboring regions also

obstructed international efforts to prevent plant invaders. In East Asia, Taiwan and Korea are the only two areas that have provided formal publications of naturalized flora (Koh et al., 2000) while equivalent documents for China and Japan are still informally published. We hope that our work will call attention to the need for compiling naturalized floras since better understanding of potential invaders at home and in neighboring areas will definitely contribute to more effective prediction and prevention of plant invasions.

#### Appendix 1. List of naturalized species of Taiwan.

Species	Origin	LF	HA	RS	U	FR	IR	W	RE
<b>Pteridophyta</b>									
<b>Adiantaceae</b>									
<i>Pityrogramma calomelanos</i> (L.) Link	Tropical America	H	P			1968		+	1
<b>Azollaceae</b>									
<i>Azolla caroliniana</i> Willd.	North America	H	P	O	2006		+	2	
<i>Azolla japonica</i> Fr. et Sav.	Japan	H	A	O	2007		+	3	
<b>Parkeriaceae</b>									
<i>Ceratopteris pteridoides</i> (Hook.) Hieron.	West Indies, Central and South America and Vietnam	H	A/P	O	1971	1950	+	3	
<b>Salviniaceae</b>									
<i>Salvinia molesta</i> D. S. Mitch.	South America	H	P	O	1996		+	3	
<b>Selaginellaceae</b>									
<i>Selaginella uncinata</i> (Desv. ex Poir.) Spring	China	H	P	O	1979		+	3	
<b>Angiosperm</b>									
<b>Dicotyledon</b>									
<b>Acanthaceae</b>									
<i>Asystasia gangetica</i> (L.) T. Anderson subsp. <i>micrantha</i> (Nees) Ensermu	Africa, India, Sri Lanka	H	P	Ch		2005	1910	+	4
<i>Blechum pyramidatum</i> (Lam.) Urban.	Tropical America	H	P	Ch		1896		+	1
<i>Hygrophila corymbosa</i> (Blume) Lindau	South East Asia	H	P	Ch	O	2001		+	3
<i>Hygrophila difformis</i> (L. f.) Blume	India, Southeast Asia	H	P	Ch	O	2000		+	3
<i>Hygrophila stricta</i> (Nees) Lindau	Southeast Asia	H	P	Ch		2004			3
<i>Justicia comata</i> (L.) Lam.	Tropical America	H	A	Ch		2006			2
<i>Justicia gendarussa</i> Burm. f.	India to southern China, Malaysia, Philippines and Java	S	P	Ch		1906			2
<i>Ruellia bittoniana</i> Leonard	Mexico	H	P	Ch	O	2004			3
<i>Ruellia tuberosa</i> L.	Central and South America	H	P	Ch		1978		+	3
<i>Strobilanthes cusia</i> (Nees) Kuntze	India, China	H	P	Ch		1982		+	3
<i>Thunbergia alata</i> Bojer ex Sims	Africa	H	P	Ch	O	1904	1910	+	3

## Appendix 1. Continued.

Species	Origin	LF	HA	RS	U	FR	IR	W	RE
<i>Thunbergia fragrans</i> Roxb.	India, Vietnam, China	V	P	Ch		2002	1910	+	3
<i>Thunbergia grandiflora</i> Roxb.	India, Bangladesh	V	P	Ch	O	1929		+	3
<b>Aizoaceae</b>									
<i>Trianthemum portulacastrum</i> L.	Pantropical	H	P	Ch		1930			1
<b>Amaranthaceae</b>									
<i>Alternanthera bettzickiana</i> (Regel) Nicholsen	Brazil	H	P	Ch		1928		+	1
<i>Alternanthera paronychioides</i> St. Hil.	Tropical America	H	P	Ch	O	1969	1920	+	1
<i>Alternanthera philoxeroides</i> (Mart.) Griseb.	Central America	H	P	Ch	O	1934		+	1
<i>Alternanthera reineckii</i> Briquet	South America	H	P		O	2004			3
<i>Alternanthera sessilis</i> (L.) R. Br.	West Indies, Mexico and Central America	H	A	Ch		1970		+	3
<i>Amaranthus caudatus</i> L.	America	H	A	Ch		1976	1928	+	2
<i>Amaranthus dubius</i> Mart. ex Thell.	New World	H	A	Ch		2002		+	5
<i>Amaranthus hybridus</i> L.	Tropical America	H	A	Ch		2000		+	2
<i>Amaranthus lividus</i> L.	Tropical Africa and Asia	H	A	Ch		1965		+	1
<i>Amaranthus palutis</i> Betoloni	Tropical America	H	A	Ch		1934		+	1
<i>Amaranthus retroflexus</i> L.	Tropical Africa	H	A	Ch		2004		+	6
<i>Amaranthus spinosus</i> L.	Tropical America	H	A	Ch		1864		+	1
<i>Amaranthus viridis</i> L.	Tropical America	H	A	Ch	C/M	1864		+	1
<i>Celosia argentea</i> L.	Africa and Tropical America	H	A	Ph	C/M	1896	1661	+	1
<i>Gomphrena celosioides</i> Mart.	Brazil and Tropical America	H	P	He	M/O	1969		+	1
<i>Pupalia micrantha</i> Hauman	Tropical Africa, Madagascar, Philippines and Luzon	H	P	Ch		2006		+	7
<b>Anacardiaceae</b>									
<i>Rhus succedanea</i> L. var. <i>dumoutieri</i> Kudo et Matsura	China	T	P	Ph	O	1931	1921	+	1
<b>Apocynaceae</b>									
<i>Alstonia scholaris</i> (L.) R. Br.	South Asia	T	P	Ph	C/O	1995		+	6
<i>Tabernaemontana pandacaqui</i> Poir	Micronesia	S	P	Ph	O	1896		+	1
<i>Vinca rosea</i> L.	East Africa	S	P	Ph	O	1915		+	3
<b>Asclepiadaceae</b>									
<i>Asclepias curassavica</i> L.	Tropical America	H	P	Ch	M/O	1896	1800	+	1
<b>Asteraceae</b>									
<i>Acmella brachyglossa</i> Cass.	Tropical America and West Indies	H	A	Ch		1992		+	8
<i>Acmella ciliata</i> (Kunth) Cass.	Northern South America	H	P	Ch	M	2006	1998	+	8
<i>Acmella oleracea</i> (L.) R. K. Jansen	Tropical America	H	A	Ch	C	1943		+	3
<i>Acmella paniculata</i> (Wall. ex DC.) R. K. Jansen	South, Southeast Asia and South China	H	A	Ch		1907			1
<i>Acmella uliginosa</i> (Swartz) Cass.	West Indies, Venezuela, Brazil, Africa, Indonesia and Malaysia	H	A	Ch	M	2004		+	9
<i>Ageratina adenophora</i> (Spreng.) R. M.	Mexico	H	P	Ch		1987		+	1
<i>Ageratina riparia</i> (Regel) R.M. King & H. Rob.	Mexico	H/S	P	Ch		2002		+	50
<i>Ageratum conyzoides</i> L.	Tropical America	H	P	Ch	C/M/O	1916		+	1
<i>Ageratum houstonianum</i> Mill.	Mexico and Tropical America	H	A	Ch	C/M/O	1875	1911	+	1
<i>Ambrosia artemisiifolia</i> L.	North America	H	A	Ch		1978		+	1
<i>Ambrosia psilostachya</i> DC.	North America	H	A/P	Ch		2004		+	10
<i>Aster subulatus</i> Michaux var. <i>sandwicensis</i> (A. Gray) A. G. Jones	Hawaii	H	A	Ch	C	1982		+	1
<i>Aster subulatus</i> Michaux var. <i>subulatus</i> (A. Gray) A. G. Jones	North America	H	A	Ch	C/M	1982		+	1
<i>Austroeupatorium inulifolium</i> (Kunth) King & Robinson	Central and South America	H/S	P	Ch		2001		+	11
<i>Bidens bipinnata</i> L.	North America	H	A	Ch		1914		+	1
<i>Bidens pilosa</i> L.	North America	H	A	Ch		1915		+	12
<i>Bidens pilosa</i> L. var. <i>radiata</i> Sch. Bip.	North and Tropical America	H	A	Ch		1909		+	1
<i>Billis perennis</i> L.	Europe	H	P	Ch	O	1984	1911		3
<i>Calypocarpus vialis</i> Less.	North America	H	P	Ch	O	1982		+	1

**摘要：**從2002年完成了臺灣第一份歸化植物名錄後至今，臺灣的歸化植物物種數量持續的增加，為了探討急劇成長的歸化物種(潛在入侵物種)在這段時間的增加模式，我們匯整截至2009年底所有發表與野外記錄到歸化物種以求對整體現狀有更好的理解。此外，臺灣與鄰近區域交通貿易頻繁，物種交流機會頗多，本篇也就此鄰近三地共同歸化物種進行比對。結果顯示，過去七年之間所有新增的歸化物種中，僅有77種植物為2002年後所歸化，其餘的植物皆為2002年以前就已歸化，2002年之後才正式發表。歸化植物與原生植物物種的比例由8%上升為12%。2002年前後歸化物種的組成、起源與生活型在優勢科的排名相當類似，僅有些微變化。在過去七年期間，臺灣地區的歸化植物數量成長一倍，歸化植物數量的成長也增加了臺灣與鄰近區域，包括中國大陸和日本，共有的歸化植物數量。然而這些新增加的歸化植物多半在2002年以前就有標本採集記錄，顯示外來植物歸化狀態的更新發表速度緩慢，以管理防治的角度而言，可能造成反應不及的狀況。

**關鍵詞：**植物誌、歸化植物、入侵植物、臺灣。
