

NOTES ON THE FLORA OF TAIWAN (6)—

The Sedoideae (Crassulaceae)⁽¹⁾

WEI-SHIN TANG⁽²⁾ and TSENG-CHIENG HUANG⁽³⁾

(Manuscript received 24 November 1988, revised version accepted 21 February 1989)

Abstract: A total of two genera and fifteen species of Taiwan Sedoideae are revised. One new genus *Hylotelephium* eleavated by Ohba is accepted; one new record *Sedum bulbiferum* Makino, and three new synonyms *S. triangulisepalum* Liu & Chung, *S. truncatistigma* Liu & Chang, (both are syn. of *S. microsepalum*), *S. taiwaniana* Ying (syn. of *S. nokoense*) are proposed; three species, *S. formosanum* N.E. Br., *S. cryptomerioides* Bart. & Yamamoto, and *S. parvisepalum* Yamamoto, are reconfirmed.

INTRODUCTION

This paper is an attempt to summarize our current knowledge about the genera and the species, including native and naturalized taxa of Taiwan Sedoideae. Because Sedoideae is quite fascinated in its taxonomy, which depends on the obscure of stableness and variability of significant characters, so the authors tried to use extra-morphological characters and its geographical distribution to find the relationship among the taxa.

The specimens examined in taxonomic treatment were partly collected by the authors and mostly from the herbaria cited below, and which are added the herbarium acronym except TAI-herbarium.

NCAI: Herbarium of National Chiayi Institute of Agriculture

NTUF: Herbarium of Department of Forestry, National Taiwan University

TAI: Herbarium of Department of Botany, National Taiwan University

TAIF: Herbarium of Taiwan Forestry Research Institute

TCF: Herbarium of Department of Forestry, National Chunghsing University

TI: Herbanium of Tokyo University, Japan

TAXONOMIC TREATMENT

CRASSULACEAE A. P. de Candolle

Subfamily Sedoideae Berger

Sedoideae Berger in Engl. & Prantl, Nat. Pfl. fam. 2 Aufl. 18a: 440. 1930.

Leaves flattened or cylindrical, alternate, opposite or rosulate. Flowers on terminal, 5-6(-12) merous, rarely 3-4; stamens 2-whorled and twice the petals, sometimes 1-whorled; petals distinct or somewhat connate.

Two genera and 15 species in Taiwan.

(1) This is a part of MS-thesis for the first author under the guidance of the second author.

(2) 湯惟新, Graduate student, Research Institute of Botany, NTU, R.O. China.

(3) 黃增泉, Professor, Department of Botany, NTU, R.O. China.

Key to the genera

1. Ovary attenuate at base; carpels distinct; leaves serrate; petals green-purple 1. *Hylotelephium*
1. Ovary not attenuate at base; carpels almost connate; leaves entire; petals yellow or white 2. *Sedum*

1. *Hylotelephium* H. Ohba

***Hylotelephium* H. Ohba** in Bot. Mag. Tokyo 90: 46. 1977.

Sedum L., Pl. ed. 1, 430. 1753, *pro parte, excl.* no. 4-15.

Sedum sect. *Telephium* S.F. Gray, Nat. Arr. Brit. Pl. 2: 539. 1821. (cited Ohba, 1977); Berger in Engl. et Prantl, Nat. Pfl.-fam. 2 Aufl. 18a: 443. 1930, *excl.* *S. Rosthornianum* Diels; Ford. in Acta. Hort. Gothob. 5: append. 54. 1930.

Sedum subgenus *Telephium* (S.F. Gray) R.T. Clausen. *Sedum* N. Amer. 70, 1975.

A perennial herb, glabrous, rosulate. Stem stout, short-rounded, sometimes woody. Leaves alternate, opposite or 3-4-5 whorled, fleshy, waxy. Inflorescence cymose, umbellate-paniculate, compound-umbellate, terminal. Flowers bisexual, solitary, 5-merous, blossom in summer and autumn; sepals fleshy, green, connect at base; petals longer than sepals, membranous, green-purple; stamens 10, 2-whorled, anthers connate at base, purple, rarely white; glands usually oblong, oblong, ascending, white; pistil distinct, ovary simple, 1-celled, almost erect, stipitate or attenuate at base, the abdomen side swelling, the placentation marginal; style usually shorter than ovary, acuminate; stigma acute and opaque; ovules elliptical, erect or ascending, inverted. Follicle erect, many-seeded, elliptical, brown, striped.

About 28 species in the temperate regions of northern hemisphere, one species in Taiwan.

Note: This new genus elevated by Dr. H. Ohba in 1977 is accepted.

1. ***Hylotelephium subcapitatum* (Hayata) Ohba** in Bot. Mag. Tokyo 90: 52. 1977.
Sedum subcapitatum Hayata, Icon. Pl. Formos. 3: 112. 1913. & Gen. Ind. Fl. Formos. 27. 1917; Sasaki, List Pl. Formos. 206. 1928; Kudo & Masam. in Ann. Rep. Taih. Bot. Gard. 2: 110. 1932; Suzuki in Masam., Short Fl. Formos. 80. 1936; Masam., List Vasc. Pl. Taiwan 62. 1954; Liu & Chung, Fl. Taiwan 3: 20-21. 1977. (Isotype, Mori s.n. Oct. 9. 1906, Yushan, TAIF!) 穗花八寶 Fig. 1.

A perennial herb, rhizomatous; aerial stem erect, 10-14 cm high, tetragonal. Leaves rosulate-alternate, obovate-rounded, 28 mm long, 20 mm wide, rounded at apex, abruptly attenuate at base, irregularly denticulate or nearly entire. Flowers in terminal capitate-umbel; sepals 5, linear, 1.4 mm long, obtuse at apex; petals 5, oblong, 3.5-4 mm long; carpels 5, distinct, lanceolate-fusiform, 3 mm long, 0.7 mm wide, acute at apex, attenuate at base. Follicle 5, whorled. Seeds obovoid-fusiform, 1.4 mm long, with longitudinal minute reticulations on surface. Flower and fruit periods from July to August.

Endemic. On high mountain at altitudes from 3,000 to 3,900 m.

2. **Sedum L.**

Sedum Tourn. ex L., Sp. Pl. 430. 1753.

Herb, glabrous, rarely hairy, annual or perennial, rarely low undershrubby, fleshy. Leaves simple, alternate or rosulate, rarely opposite or verticillate, entire or toothed, rarely spine-tipped, flat or cylindric, usually sessile. Flowers bisexual, rarely unisexual by abortion, sometimes dioecious, in terminal cymes or solitary, rarely in spikes, yellow or white; sepals 4-5, distinct or few connate at base; petals as many as sepals, free, persistent; stamens as twice as sepals, perigynous, the filaments subulate or filiform, often adnate to petals; nectariferous glands 5 or 4, minute; carpels 5, sometimes 4, free or shortly connate at base; style short, with stigma at apex; ovules rather many. Follicle 4-5, free, mostly with many seeds.

About 350 species in the temperate regions and higher mountains in the Tropics of the Old World, also in N. and S. America; 14 species in Taiwan.

Key to the species

1. Plants with glandular hair 2
1. Plants without glandular hair 3
2. Petals white 4. *Sedum drymarioides*
2. Petals yellow 13. *Sedum stellariaefolium*
3. Sterile branches present 4
3. Sterile branch absent 5
4. Leaves 4-verticillate on sterile branches 7. *Sedum mexicanum*
4. Leaves rosulate on sterile branches 12. *Sedum sekiteiense*
5. Leaves less than 1 cm long 6
5. Leaves more than 1 cm long 7
6. Flowers 1, occasionally up to 2-10 14. *Sedum uniflorum*
6. Flowers more than 10 9. *Sedum morrisonense*
7. Leaves oblong or oblong-lanceolate 8
7. Leaves spatulate 9
8. Leaves oblong; sepals equal in length, 1.5 mm long 8. *Sedum microsepalum*
8. Leaves oblong-lanceolate; sepals unequal in length, 1.5-3 mm long 11. *Sedum parvisepalum*
9. Leaves scale spatulate 3. *Sedum cryptomariooides*
9. Leaves not scale spatulate 10
10. Axillary bulblets present 2. *Sedum bulbiforum*
10. Axillary bulblets absent 11
11. Stem with glandular spots; cymes spike-like 10. *Sedum nokoense*
11. Stem without glandular spot; cymes not spike-like 12
12. Carpels erect when mature 6. *Sedum formosanum*
12. Carpels spreading when mature 13
13. Carpels horizontally spreading when mature; seeds white 1. *Sedum actinocarpum*
13. Carpels spreading at a definite angle when mature; seeds red 5. *Sedum erythrospermum*

1. *Sedum actinocarpum* Yamamoto, Suppl. Icon. Pl. Formos. 2: 17. 1926; Sasaki, List Pl. Formos. 205. 1928; Kudo & Masam. in Ann. Rep. Taih. Bot. Gard. 2: 109. 1932; Masam., List Vasc. Pl. Taiwan 61. 1954. Liu & Chung, Fl. Taiwan 3: 16. 1977.

星果佛甲草 Fig. 2.

An annual fleshy herb; stem slender, erect, simple, dichotomously or rarely trichotomously branched upwards, branches glabrous. Leaves alternate, occasionally opposite, spatulate, 8-27 mm long, 4-11 mm wide, rounded or obtuse at apex, obtuse at base, entire. Flowers in cymes, sessile; sepals 5, unequal in length, spatulate or oblanceolate or linear-oblanceolate, 2.5-4.5 mm long, 2-3 mm wide, obtuse or acute at apex, cuneate at base, glabrous, greenish; petals 5, elongate-oblong or lanceolate, 4 mm long, 1.5 mm wide, acuminate at apex, somewhat cuneate at base, 1-nerved, yellow; stamens 10, perigynous; anthers suborbicular or oblong or ovate, 0.4 mm long, subretuse at apex, emarginate at base; glands 5, 0.5 mm long, 0.3 mm wide; carpels 5 (rarely 4), connate at base, free upward, suboblong or ovate, 2.5 mm long, acuminate-rostrate at apex, stellate-spreading when mature, 8 mm in diameter, triangular, beak 0.2 mm long. Seeds very small,

2. *Sedum bulbiferum* Makino in Bot. Mag. Tokyo 17:145. 1903. 珠芽佛甲草 Fig. 3.

A biennial fleshy herb; stem 20-60 cm long, ascending or erect. Leaves alternate, sessile, spatulate-ob lanceolate, 10-15 mm long, 2-4 mm wide, rounded or obtuse at apex, stiped at base, entire; axillary bulblets 4-6, rarely 2 or 8-10. Flowers in terminal cymes, 5-merous; sepals free, lanceolate to oblanceolate, 2-4 mm long, greenish, ascending at the blossom; petals free, linear-ob lanceolate to narrow-ob lanceolate, 4-5 mm long, acute at apex, flat-spreading at blossom, yellow; stamens shorter than petals, dark yellow at mature, almost no pollen grains; glands obovate, 0.6 mm long, semi-hyaline, white; pistils 3-4 mm long; ovary 2.5-3 mm long, connate about 1 mm at base; style 1 mm long. Flower period from April to June, usually no seed; asexual reproduction by axillary buds.

Southern China & Japan (Fu, 1984); Taiwan only found in Chitou, naturalized species. A new record.

Sedum uraiense Hayata, Icon. Pl. Formos. 6: 20. 1916 & Gen. Ind. Fl. Formos. 27. 1917; Sasaki, List Pl. Formos. 206. 1928. 大葉火焰草 Fig. 5.

An annual fleshy herb; stem creeping at base, with glandular hairs throughout the whole plant, ca. 10 cm high. Leaves membranaceous, somewhat thick, opposite or rarely verticillate, ovate or rounded-ovate, 1.5-2 cm long, 1.3-1.5 cm wide, obtuse at apex, suddenly cuneate at base, entire; petioles 5-8 mm long. Flowers in cymes, pedicellate; pedicels 2-5 mm long; sepals 5, oblong-triangular, 1.5 mm long, 0.7 mm wide, densely hairy outside, glabrous inside, obtuse at apex; petals 5, lanceolate, 3-3.5 mm long, 0.7-1 mm wide, acuminate at apex, truncate at base, white; stamens 10; filaments filiform, 2 mm long, glabrous; anthers globose, 0.25 mm in diameter; glands 5, opposite with carpels, rectangular, 0.2 mm long; carpels 5, lanceolate, glandular-hairy; styles cuneate at apex. Follicles 5, elliptic, acute; seeds ovoid, elliptic, truncate on both sides, about 0.5 mm long, with 8-13 deep grooves; testa hard, darkbrown. Flower and fruit periods from April to May.

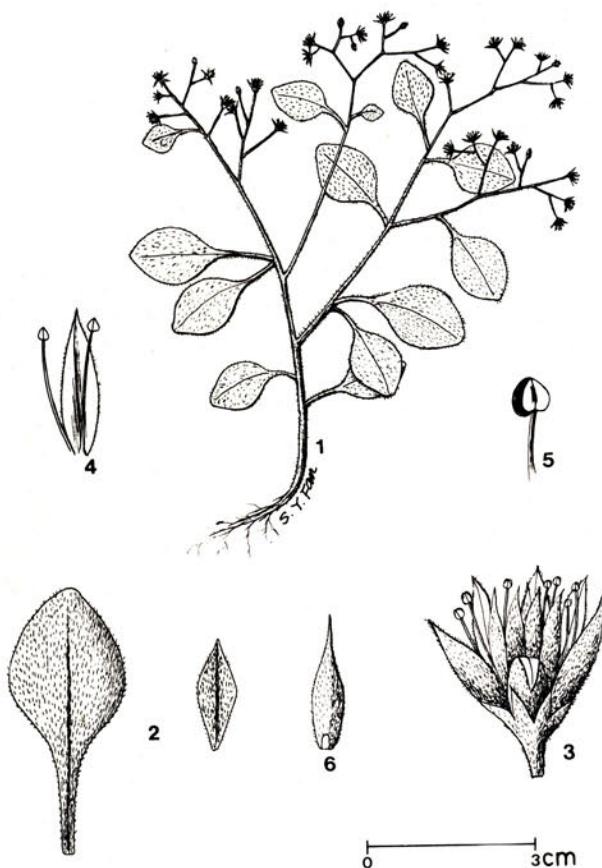

Fig. 5. *Sedum drymarioides* Hance. 1. Habit; 2. Leaves; 3. Flower; 4. Petal and stamens; 5. Stamen; 6. Pistil with a gland.

Southern part of China. This is a rare species in Taiwan, only found in Wulai.

Specimens cited:

6. ***Sedum formosanum*** N.E. Br. in Gard. Chron. 26: 134. 1885; Forb. & Hemsl. in Journ. Linn. Soc. Bot. 23: 285. 1887; Matsum. & Hay. in Journ. Coll. Sci. Univ. Tokyo 135. 1906.

Sedum alfredi sensu Liu & Chung, Fl. of Taiwan 3: 16. 1977; non Hance.

臺灣佛甲草 Fig. 7.

A green annual fleshy herb; stem tufted, 10-15 cm high, erect, rather stout, densely leaved, branching dichotomously or trichotomously. Leaves alternate, occasionally opposite, spatulate to obovate, 10-15 mm long, 8-12 mm wide, broadly rounded at apex, obtuse to cuneate at base. Cymes rather large, 5-8 cm across, many-flowered. Flowers sessile, about 1 cm across, yellow; bracts leaf-like; sepals 5, unequal in length, linear-lanceolate, 2-3 mm long, obtuse at apex; petals 5, narrowly lanceolate, acuminate at apex, 6-7 mm long, yellow; stamens 10, shorter than the petals; anthers yellow; carpels 5, erect when mature, broadly lanceolate, 5-6 mm long, shortly acuminate at apex, terminated by a style about 1 mm long. Seeds many, oblong, 0.4 mm long. Flower and fruit periods from March to June.

Japan, the Ryukyu and Philippines. Taiwan, along the seashores.

Note: This is a reconfirmed species.

Sedum mexicanum Britt. Bull. New York Bot. Gard. 1: 257. 1899.

Sedum lineare sensu Liu & Chung, Fl. Taiwan 3: 19. 1977; non Thunb.

Sedum obtuso-lineare Hayata Icon. Pl. Formos. 3: 111. 1913. 松葉佛甲草 Fig. 8.

Basal stem decumbent, rooting, weak, 10-15 cm high. Sterile branches erect, slender branched, densely leafy, 2-8 cm long, the leaves 4-worlded, spreading. Floriferous branches ascending, loosely leafy, up to 20 cm long, the leaves very long and narrow, short-spurred, linear-lanceolate, subterete 5-20 mm long. Flowers sessile, spreading along the slender, long peduncles; bracts lanceolate, subobtuse at apex, 3-4 mm long; sepals 5, blunt spurred, lanceolate, subobtuse at apex, unequal in length, 3.2-5 mm long; petals 5, lanceolate, subobtuse and short mucronate at apex, 5-6 mm long, golden-yellow; stamens 10, 4-5 mm long; anthers

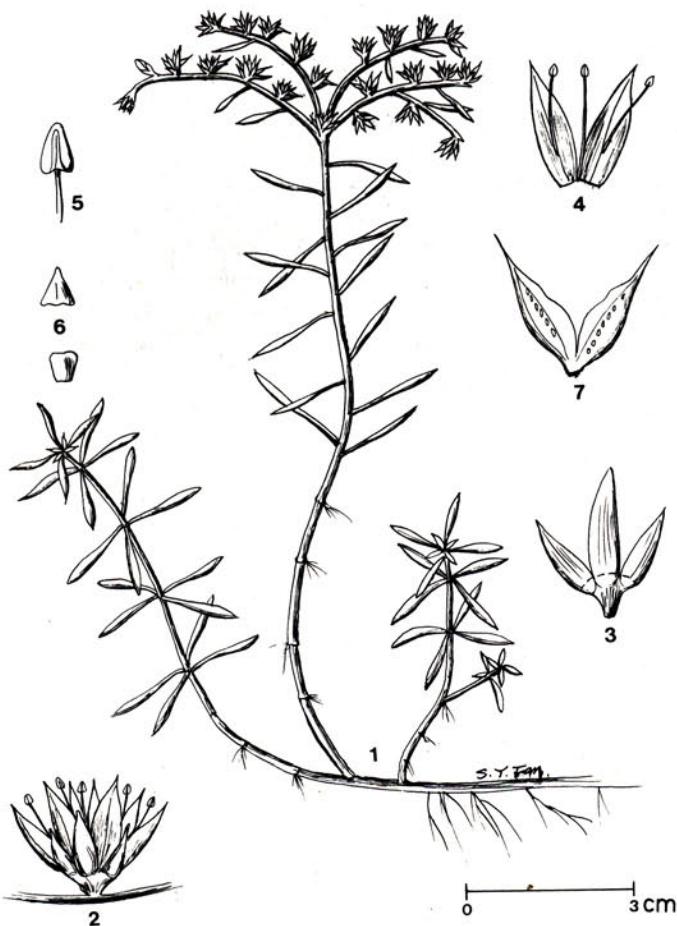

Fig. 8. *Sedum mexicanum* Britt. 1. Habit; 2. Flower; 3. Sepals; 4. Petals and stamens; 5. Stamen; 6. Glands; 7. Follicle.

narrow, reddish; glands spathulate-subquadrate, emarginate at apex, thick, 1×0.8 mm, yellow; young carpels turgid, 5 mm long. Flower and fruit periods from May to June.

Mexico and America (Forderstron, 1935). Naturalized.

Sedum truncatistigma Liu & Chung, l.c. 3: 23. 1977, syn. nov. (Holotype, N.J. Chuang 276, Lomawangshan, NTUF!)

A glabrous herb; stem erect, decumbent at base, rooting at nodes, suberect, upward, loosely branched above, 10–20 cm high. Leaves alternate, sessile, oblong, 2–2.5 cm long, 0.5 mm wide, obtuse at apex, cuneate at base, entire. Flowers in cymes, sessile; cymes loosely branched; sepals 5, equal in length, triangular, ca. 1.5 mm long and wide, acute at apex; petals 5, equal in length, linear-lanceolate, 6 mm long, 2 mm wide, acuminate at apex, yellow; stamens 10, 3–5 mm long; anthers yellow, extrose; glands 5, 1.2 mm, retuse; carpel 5, connate at base, free upward, 5 mm long. Follicles 5, coriaceous, 7 mm long; seeds many. Flower and fruit periods from May to July.

Endemic. On high mountain at altitudes from 1,700 to 3,000 m.

Specimens cited:

Sedum japonicum sensu Yamamoto, Suppl. Icon. Pl. Formos. 2: 21. 1926; Liu & Chung, l. c. 3: 17. 1977; non Sieb. ex Miq.

An erect perennial herb, nearly 8 cm high, basiramously branched, reddish, glabrous. Leaves approximately oblong-lanceolate, obtuse at apex. 6 mm long, 1.5 mm wide. Cymes trichotomous, many-flowered, bracteate; bracts leafy, shorter than flowers. Flowers sessile, small, 7 mm long, campanulate; sepals 5, unequal in length, oblong-linear, obtuse at apex, half as long as petals, thick; petals 5, oblong-linear, obtuse at apex, 6.5 mm long, yellow; stamens 10, as long as petals; anthers

Fig. 10. *Sedum morrisonense* Hayata. 1. Habit; 2. Leaves; 4. Flower; 5. Petal and stamens; 6. Stamen; 7. Pistil with glands; 8. Seed.

oblong; glands 5, hypogynous, minute, broadly quadrate; style 6 mm long; stigma pointed. Follicles 5, membranaceous, shortly connate at base, erect or patent oblong; seeds oblong, obscurely striate, with striations very minutely muriculate. Flower and fruit periods from June to September.

Endemic. On high mountain above 2,500 m.

能高佛甲草 Fig. 11.

A fleshy herb, 9-20 cm high, decumbent at base, rooting at nodes, branched

above, with glandular spots. Leaves alternate, spatulate, 6–10 mm long, 3–5 mm wide, obtuse at apex, entire. Flowers in cymes, sessile; cymes spike-like, terminal; sepals 5, unequal in length, oblanceolate or subspatulate or linear-lanceolate, 3 mm long, 1 mm wide, obtuse at apex, cuneate at base, green; petals 5, equal in length, linear-lanceolate, 5 mm long, 1.5 mm wide, subacute at apex, 1-nerved, yellow; stamens 10, perigynous, 2-whorled; filament 4 mm long; anthers yellow, obtuse at apex, cordate at base, 0.8 mm long, 0.5 mm wide; glands 5; carpels 5, oblong, 2 mm long, 1.5 mm wide, acuminate-beaked at apex. Follicles 5, stellate-spreading; seeds many, oblong, 0.8 mm long, 0.3 mm wide, embryo glabrous, oblong, 0.5 mm long, 0.25 mm wide. Flower and fruit periods from July to September, sometimes to November.

Endemic. On mountain at altitudes from 1,500 to 3,500 m.

Sedum microsepalum sensu Liu & Chung, Fl. Taiwan 3: 10. 1977, *pro parte; non* Hayata. 尖萼佛甲草

A fleshy herb; stem glabrous, decumbent at base, rooting at nodes, erect upwards, non-branched, 17-25 cm high. Leaves alternate, oblanceolate, or oblong-lanceolate, 20-25 mm long, 0.5 mm wide, obtuse at apex, cuneate at base, entire. Flowers in cymes, sessile; sepals 5, unequal in length, linear or linear-lanceolate, 1.5-3 mm long, 0.5 mm wide, obtuse at apex, green, glabrous; petals 5, linear-lanceolate, 6 mm long, 0.2 mm wide, acuminate at apex, yellow; stamens 10, 2-whorled; anthers yellow, subcordate at base, obtuse at apex; glands 5, opposite to carpels 5, connate at base, stigma beak-like, 2 mm long. Follicles 5, coriaceous, 4-5 mm long, 0.1 mm wide; tests yellow. Flower and fruit periods from August to October.

Endemic. On mountain at altitudes from 1,800 to 3,000 m.

Specimens cited:

Nantou Co.: Yushan, Kawakami & Mori s. n. Oct. 1906 (TAIF). Fengfunshan, C. C. Hsu 6204. Chitou, N. J. Chung 211 (NTUF).

摘要

臺灣景天科之植物共可分為兩亞科：燈籠草亞科及佛甲草亞科。本文僅處理佛甲草亞科十五個分類羣，認定兩屬——八寶屬 (*Hylotelephium*) 和佛甲草屬 (*Sedum*)，並增加一新記錄種——珠芽佛甲草 (*Sedum bulbiferum* Makino) 及三新同物異名——等萼佛甲草 (*Sedum triangulisepalum* Liu & Chung)、截柱佛甲草 (*Sedum truncatistigma* Liu & Chung)、青山佛甲草 (*Sedum taiwaniana* Ying)，並確定臺灣佛甲草 (*Sedum formosanum* N. E. Br.)、杉葉佛甲草 (*Sedum cryptomerioides* Bart. & Yamamoto) 和尖萼佛甲草 (*Sedum parvisepalum* Yamamoto) 等三種的存在。
