

Additional Remarks of Ranunculaceae in Taiwan (5) — The genus *Clematis* L.

T. Y. Aleck Yang ^(1,3) and Tseng-Chieng Huang ⁽²⁾

(Manuscript received 12 August 1995; accepted 4 September 1995)

ABSTRACT: This is a taxonomic study of *Clematis* L. (Ranunculaceae) in Taiwan. Twenty taxa, including thirteen species, two subspecies and five varieties are described: one new species, i.e., *C. tamurae* T. Y. A. Yang et T. C. Huang and one new combination, *C. parviloba* Gard. ex Champ. subsp. *bartlettii* (Yamam.) T. Y. A. Yang et T.C. Huang, are proposed. A key, description and distribution maps for each taxon are given.

KEY WORDS: *Clematis* L., Ranunculaceae, Taxonomy, Taiwan.

INTRODUCTION

The genus *Clematis* L. is one of the largest genera in the family Ranunculaceae. Opinions about the total number of species vary 230 species (Mabberley, 1987), 250 species (Jury, 1978) or 300 species (Tamura, 1967, 1987). It is widely distributed, ranging from the tropical regions to frigid zones and from sea level to high altitude (Tamura, 1967; Chang *et al.*, 1980).

Forbes and Hemsley (1886) first recorded 3 species of *Clematis* in the Taiwanese flora, then Henry (1896) reported 7 species. Over the following five decades, Taiwanese *Clematis* were studied by Japanese taxonomists until Huang (1960) who is the first Chinese taxonomist, revised this genus. The chronological study of Taiwanese *Clematis* by selected representative authors is shown in the Table 1. There are 20 taxa including 9 endemic taxa represented in Taiwan.

In the present work, one new species, *C. tamurae* T. Y. A. Yang et T. C. Huang, and one new combination, *C. parviloba* Gard. ex Champ. subsp. *bartlettii* (Yamam.) T. Y. A. Yang et T. C. Huang, for Taiwan are reported. Distribution maps of *Clematis* on Taiwan with descriptions and a key to the treated taxa are given.

Key to the taxa of *Clematis* in Taiwan

1. Erect shrubs
 2. Leaflets large, more than 70 mm long; flowers pink 13. *C. psilandra*
 2. Leaflets small, less than 35 mm long; flowers purple or blue 17. *C. tsugetorum*

3. Corresponding author.

Table 1. The chronological study of Taiwanese *Clematis* by selected authors

year	author	taxon	species	variety	total number
1886	Forbes and Hemsley		3	0	3
1896	Henry		7	0	7
1906	Matsumura and Hayata		9	1	10
1910	Kawakami		17	2	19
1908-1920	Hayata		17	3	20
1928	Sasaki		17	3	20
1932	Kudo and Masamune		19	2	21
1936	Suzuki		22	2	24
1954	Masamune		23	2	25
1960	S.S.Huang		23	1	24
1973	Shimizu		20	2	22
1976	Liu and Hsieh		17	4	21
1979	Lui and Liao		17	4	21
1980	Chang <i>et al.</i>		16	1	17
1982	T. I. Yang		18	4	22

1. Climbing vines
3. Leaves simple or ternately compound
4. Sepals spreading; stamens glabrous
5. Sepals more than 10 mm wide; achenes glabrous 11. *C. montana*
5. Sepals less than 8 mm wide; achenes pubescent
6. Leaflets more than 25 mm wide, ovate or broadly ovate
7. Leaflets entire, unlobed, glabrous on both sides
8. Filaments curved 3. *C. crassifolia*
8. Filaments smooth, straight 10. *C. meyeniana*
7. Leaflets coarsely serrate, 3-lobed, at least pubescent on abaxial side 6. *C. grata*
6. Leaflets less than 23 mm wide, narrowly ovate or narrowly oblong 4. *C. formosana*
4. Sepals upward; stamens pubescent
9. Leaves simple 7a. *C. henryi* var. *henryi*
9. Leaves compound ternate
10. Leaflets glabrous; flowers white 7b. *C. henryi* var. *morii*
10. Leaflets pubescent; flowers golden 9. *C. leschenaultiana*
3. Leaves pinnately or biternately compound
11. Sepals 6, rarely 5
12. Terminal leaflets less than 60 mm long; flowers pale pink 1. *C. akoensis*
12. Terminal leaflets more than 70 mm long; flowers dark purple 15. *C. tashiroi*
11. Sepals 4
13. Leaflet margins serrate
14. Sepals upward; stamens pubescent 8. *C. lasiandra*
14. Sepals spreading; stamens glabrous
15. Flowers large, c. 28-45 mm diam., white 12. *C. parviloba* subsp. *bartlettii*
15. Flowers small, c. 15-25 mm diam., yellowish-green 6. *C. grata*
13. Leaflet margins entire

- 16. Flowers yellowish-green; petioles stipulate 5. *C. gouriana* ssp. *lishanensis*
- 16. Flowers white; petioles estipulate
 - 17. Petiolule articulate; leaves coriaceous
 - 18. Ovaries glabrous; fruits glabrous 18a *C. uncinata* var. *uncinata*
 - 18. Ovaries pubescent; fruits pubescent 18b *C. uncinata* var. *okinawensis*
 - 17. Petiolule non articulate; leaves chartaceous or subcoriaceous
 - 19. Leaflets 5, rarely 7
 - 20. Ratios between length and width of leaflet = 1.2—1.9 ... 16. *C. terniflora* var. *garanbiensis*
 - 20. Ratios between length and width of leaflet = 2.0—3.5 2. *C. chinensis*
 - 19. Leaflets 15 14. *C. tamurae*

屏東鐵線蓮 Fig. 1

Type: Taiwan: Ako (Pingtung), Miharashi-toge, Kawakami & Mori 3137 (holotype: TI!; isotype: TAIF!).

Clematis owatarii Hayata in Journ. Coll. Sci. Univ. Tokyo **30**: 17. 1911; *syn. nov.* Type: Taiwan: Ako (Pingtung), Owatari s.n. Mar. 1898 (holotype: TI!, isotype: TAIF!).

Clematis dolichosepala Hayata, Icon. Pl. Form. **3**: 1. 1913; *syn. nov.* Type: Taiwan: Hieranzan (Henchun), Kawakami & Sasaki s.n. Feb. 1911 (holotype: TI!; isotype: TAIF!).

A scandent perennial woody vine. Stem dark red, sulcate, glabrous when mature. Leaves pinnately compound, subcoriaceous; petioles tendrillate, c. 40—70 mm long; stipules absent. Leaflets 5, sometimes 3, c. (22-) 37—58 (-74) mm long, (15-) 30—46 (-54) mm wide, deltoid or broadly elliptic; apex finely retuse; base cordate, cuneate or obtuse; rarely lobed; margin sparsely serrulate, rarely entire; glabrous on both surfaces; main veins 5, nerves flat or sunken on adaxial side; margin and nerves elevated on abaxial side; petiolulate. Inflorescence a dichasium or cymes, sometimes 1-flowered, axillary; pedicels glabrous, trichotomously branched; bracts and bracteoles elliptic-lanceolate or lanceolate, subcoriaceous, glabrous on both sides. Flowers c. 35—75 mm diam., pale pink, spreading. Sepals 6, rarely 5, c. 20—35 mm long, 5—13 mm wide, obovate-lanceolate; apex obtuse-mucronulate; base cuneate; glabrous or nearly so inside and densely velutinous outside. Stamens numerous, c. 8—15 mm long, glabrous, centripetal, inner ones shorter; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective short excurrent beyond the pollen sacs, c. 0.18—0.2 mm long; filaments linear and flat, blue when fresh and brown when dry. Carpels numerous, with white sericeous hairs. Fruits c. 40—48 mm long; achenes c. 5—8 mm long, narrowly ovate or elliptic, compressed laterally, yellowish brown or reddish brown with white velutinous hairs; style persistent and lengthening to become caudate after anthesis, with white or pale yellow bearded hairs.

Flowering season starts from late winter or early spring, i.e. November to February of the following year; fruiting season is from December to March.

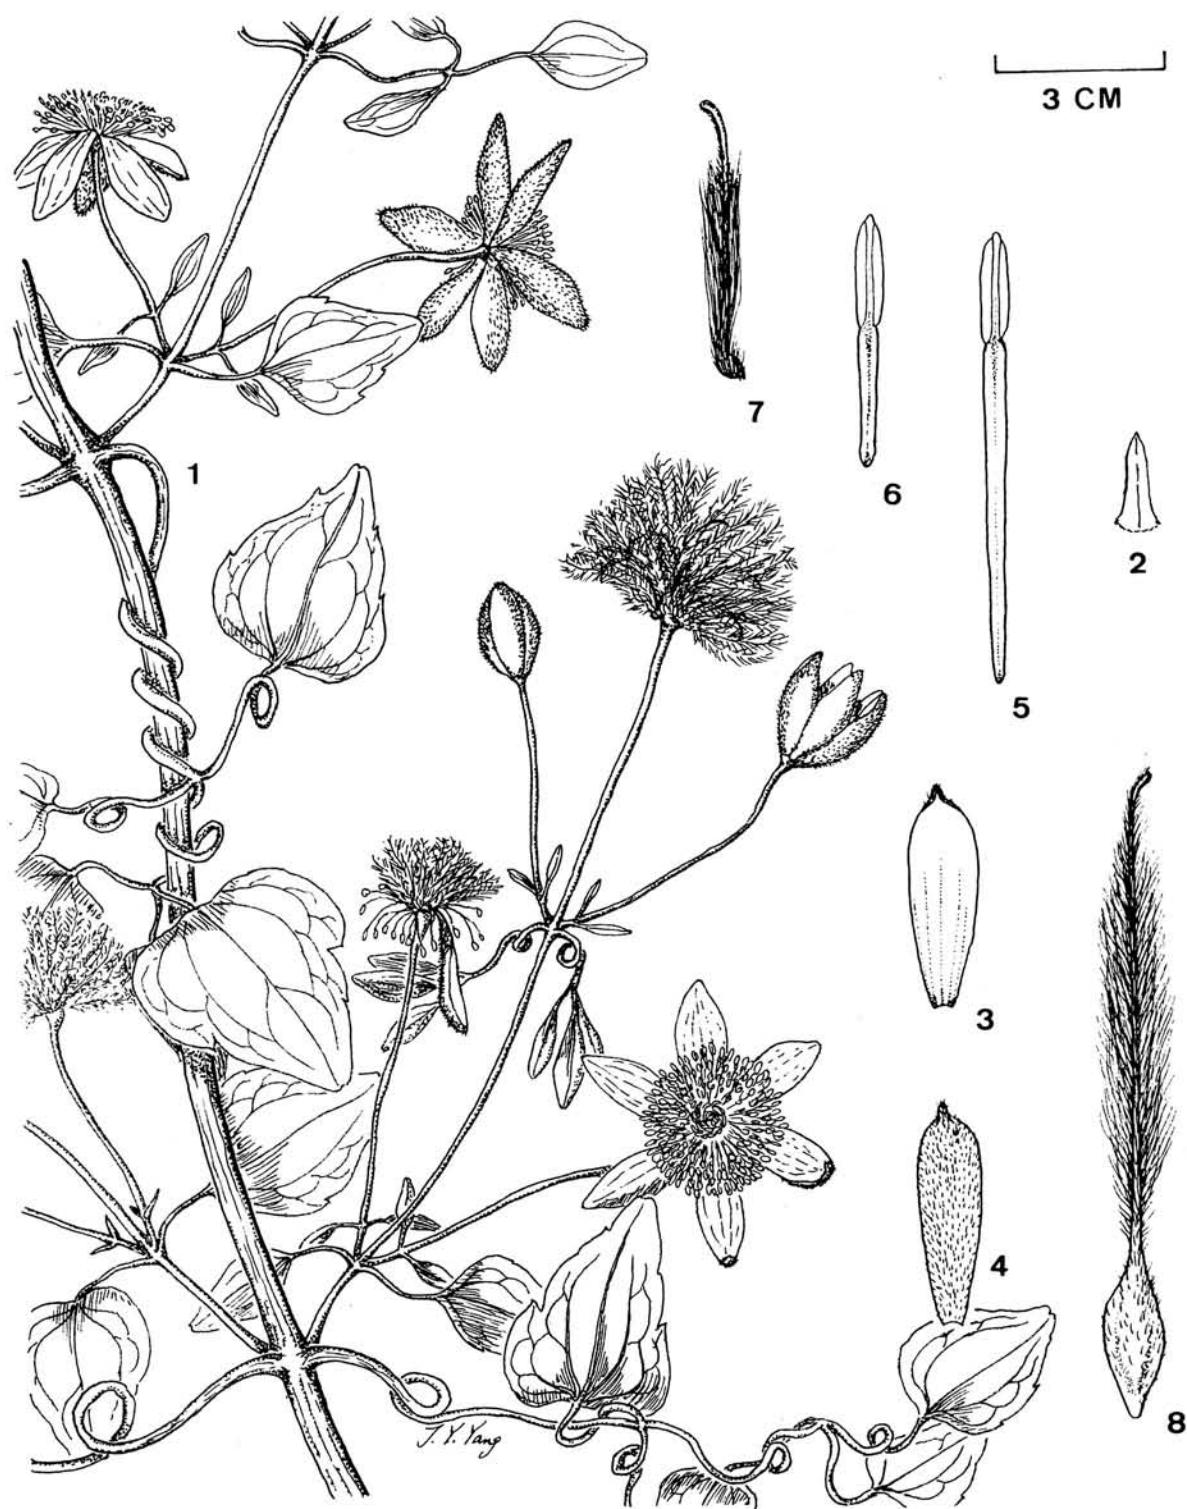

Fig. 1. *Clematis akoensis* Hayata (Ranunculaceae). 1. Habit; 2. Bracteole; 3. & 4. Sepals, 3, adaxial and 4, abaxial sides; 5. & 6. Stamens; 7. Carpel; 8. Fruit.

Distribution: Endemic to Taiwan, found only on Hengchun Peninsula.

Habitat and Ecology: It is growing in sunny places or forest margins at an altitude below 800 m. Fig. 2.

Clematis minor Lour., Fl. Cochinch. 345. 1790.

Clematis benthamiana Hemsl. in Journ. Linn. Soc. Bot. 23: 2. 1886; *quoad spec.*

A scandent perennial herbaceous vine. Stem green fresh and turning black when dry, sulcate, sparsely pubescent or glabrous. Leaves pinnately compound, chartaceous; petioles tendrillate, c. 30–50 mm long; stipules absent. Leaflets 5–7–15, c. (20–) 36–69 (–78) mm long, (10–) 15–29 (–38) mm wide, ovate, narrowly ovate or ovate-lanceolate; apex acuminate; base obtuse, cuneate or cordate; rarely lobed; margin entire; glabrous on both surfaces or sparsely pubescent on adaxial surface; main veins 3 to 5, nerves flat or sunken on adaxial side and elevated on abaxial side; petiolulate. Inflorescence cymes, axillary or terminal; pedicels pubescent, trichotomously branched; bracts and bracteoles elliptic or oblong-lanceolate, sparsely pubescent or glabrous on adaxial side; densely pubescent on abaxial side. Flowers c. 10–20 mm diam., white, spreading. Sepals 4, c. 7–12 mm long, 2–4 mm wide, elliptic to oblong; apex obtuse-mucronulate; base cuneate; glabrous or nearly so inside and densely velutinous outside. Stamens numerous, c. 4–8 mm long, glabrous, centripetal; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective shortly excurrent beyond the pollen sacs, c. 0.10–0.15 mm long; filaments linear and flat. Carpels numerous, with white sericeous hairs. Fruits c. 25–40 mm long; achenes c. 4–6 mm long, orbicular or broadly ovate, compressed laterally, dark brown with pale yellow velutinous hairs; style persistent and lengthening to become caudate after anthesis, with brown or pale yellow bearded hairs.

In Taiwan, flowering season July to November; fruiting season August to November.

Distribution: Widly distributed in Southwest, South, Southeast, Central China (Provs. Anhui, Fujian, Jiangxi, Henan, Hubei, Hunan, Guangdong, Guangxi, Sichuan, Guizhou, Yunnan, Shaanxi), Hongkong and Taiwan, and northern Vietnam.

Habitat and Ecology: It is growing in open land or forest margins at altitudes from 500 to 1800 m around the whole Island. Fig. 4.

厚葉鐵線蓮 Fig. 5

Type: Hongkong: in a ravine on Victoria Peak, Wilford 106 (lectotype is designated here: K!; isolectotype: K!).

Fig. 5. *Clematis crassifolia* Benth. (Ranunculaceae). 1. Habit; 2. Flower; 3. Bracteole, abaxial side; 4. & 5. Sepals, 4, adaxial and 5, abaxial sides; 6. stamen; 7. Carpel; 8. Fruit.

A scandent perennial woody vine. Stem dark red, sulcate, glabrous. Leaves ternately compound, subcoriaceous or crassate; petioles tendrillate, c. 66–102 mm long; stipules absent. Leaflets 3, c. (75-) 81–98 (-114) mm long, (29-) 35–58 (-95) mm wide, broadly ovate, elliptic or oblong; apex acute or acuminate; base obtuse or cuneate; unlobed; margin entire; glabrous on both surfaces; main veins 3, nerves flat or elevated on adaxial side and elevated on abaxial side; petiolulate. Inflorescence cymes, terminal or axillary; pedicels almost glabrous, trichotomously branched; bracts and bracteoles subulate, coriaceous, densely albovelutinous on both sides. Flowers c. 24–40 mm diam., white, spreading. Sepals 4, c. 12–21 mm long, 4–6 mm wide, lanceolate or oblanceolate; apex acute-mucronulate; base cuneate; velutinous or sparsely velutinous inside and densely velutinous outside. Stamens numerous, c. 5–10 mm long, glabrous, centripetal; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective shortly excurrent beyond the pollen sacs, c. 0.05–0.09 mm long; filaments linear, flat and curved. Carpels numerous, with white sericeous hairs. Fruits c. 29–46 mm long; achenes c. 4–6 mm long, narrowly ovate or elliptic, compressed laterally, yellowish brown with white velutinous hairs; style persistent and lengthening to become caudate after anthesis, with white or pale yellow bearded hairs.

Flowering season starts from late winter, December to January of the following year; fruiting season is from January to February.

Distribution: Distributed around South China (Provs. Hunan, Fujian, Guangdong, Guangxi, Hainan), Hongkong, Taiwan and South Japan (Kyushu).

Habitat and Ecology: It is growing in sunny places or forest margins of northern Tropic of Cancer areas, e.g. Mt. Alishan, Hsitou and Yangmingshan at altitudes of 300—2300 m. Fig. 2.

Specimens examined:

Taipei: Pinglin, H.N. Yang 1399 (TAI), Yang 34A (TNM); Wulai, W.S. Tang 735 (TAI), Mt. Tapaokoshan, 870 m, H.L. Ho et al. 805(A); Yangmingshan, M.T. Type: Formosa: Ape's Hill, G.M.H. Playfair 307 (lectotype is designated here: K!; isolectotypes: K!, NY!).

Clematis sasakii Shimizu in *Taiwania* 18(2): 173. 1973; *syn. nov.* Type: Taiwan: Daikwanzan, S. Sasaki s.n. Oct 1933 (holotype: TAI!; isotype: TAI!).

A scandent perennial herbaceous vine. Stem olive, sulcate, densely albovelutinous hairs, sometimes becoming glabrous when mature. Leaves ternately compound, chartaceous; petioles tendrillate, c. 28–62 mm long; stipules absent. Leaflets 3, c. (31-) 32–63 (-74) mm long, (8-) 11–23 (-34) mm wide, ovate-lanceolate or elliptic-lanceolate; apex acute-mucronulate or acuminate-mucronulate; base obtuse; unlobed or 3-lobed, sometimes deeply lobed and segments lanceolate or linear; margin entire; glabrous or nearly so on adaxial surfaces; sparsely pubescent on abaxial surface but densely pubescent along nerves; main veins 3, nerves flat or sunken on adaxial side and elevated on abaxial side; petiolulate. Inflorescence cymes, axillary or terminal; pedicels densely velutinous, trichotomously branched; bracts and bracteoles elliptic-lanceolate or subulate, chartaceous, glabrous on adaxial side densely pubescent on abaxial side. Flowers c. 15–25 mm diam., white, spreading. Sepals 4, c. 8–13 mm long, 3–4 mm wide, elliptic or elliptic-lanceolate; apex acute-mucronulate; base obtuse; glabrous or nearly so inside and densely velutinous outside. Stamens numerous, glabrous, centripetal, inner ones c. 2–3 mm long, outer ones c. 5–9 mm long; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective shorter than the pollen sacs; filaments linear and flat. Carpels numerous, with white sericeous hairs. Fruits c. 17–45 mm long; achenes c. 3–5 mm long, round or elliptic, compressed laterally, yellowish brown or reddish brown, white velutinous hairs; style persistent and lengthening to become caudate after anthesis, with pale yellow bearded hairs.

Flowering season November to January of the following year; fruiting season January to February.

Distribution: Endemic to Taiwan.

Habitat and Ecology: It is growing in sunny places or forest margins around limestone areas, mainly in southern and eastern Taiwan below altitude 800 m. Fig. 6.

Specimens examined:

Type: Taiwan: Nantou, E-W Cross Island Highway 103K, Yang 2623 (holotype: TAI!; isotypes: HAST!, K!, PE!, TUNG!).

Clematis taiwaniana auct. non Hayata: Kudo & Masamune in Ann. Rep. Taihoku Bot. Gard. 2: 77. 1932.

A scandent perennial woody vine. Stem sulcate, densely velutinous hairs. Leaves flammuliform, chartaceous; petioles tendrillate, c. 35–65 mm long; stipules 4, palmate, coarsely serrate, chartaceous. Leaflets 9–15, c. (36-) 43–62 (-75) mm long, (12-) 16–29 (-40) mm wide, elliptic or elliptic-lanceolate; apex acute, rarely acuminate; base cordate, obtuse or cuneate; unlobed or sometimes 3–5-lobed; margin entire; glabrous or nearly so on adaxial surface and sparsely velutinous on abaxial surface; main veins 3 to 5, nerves flat or sunken on adaxial side and elevated on abaxial side; petiolulate, tendrillate, articulate near leaflet base. Inflorescence a panicle-cymes or cymes, axillary; pedicels velutinous, trichotomously branched; bracts and bracteoles leaf-like, sulcate or oblong-lanceolate, chartaceous, glabrous or sparsely velutinous on adaxial side and densely velutinous on abaxial side. Flowers c. 10–15 mm diam., yellowish-green or pale yellow, spreading. Sepals 4, c. 7–10 mm long, 4–5 mm wide, oblong; apex acute-mucronulate; base cuneate or obtuse; glabrous or nearly so inside and densely villose outside. Stamens numerous, c. 3–6 mm long, glabrous, centripetal, inner ones shorter; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective shorter than or equal to the pollen sacs;

filaments linear and flat. Carpels numerous, with golden sericeous hairs. Fruits c. 19–37 mm long; achenes c. 2–4 mm long, ovate-elliptic or elliptic, convex on both sides, dark brown or nearly black with yellow velutinous hairs; style persistent and lengthening to become caudate after anthesis, with pale yellow bearded hairs.

Flowering season starts from late summer, September to November; fruiting season is from November to February the following year.

Distribution: Endemic to Taiwan.

Habitat and Ecology: It is growing in open land or near forest margins in the Central Mountains, including Yushan Mountains and Alishan Mountains at altitudes between 1200 and 2600 m. Fig. 7

Specimens examined:

A scandent perennial woody vine. Stem sulcate, densely velutinous hairs. Leaves ternate, pinnate or biternate, chartaceous; petioles tendrillate, c. 42–97 mm long. Leaflets 3–5 (-7)–9, c. (23-) 37–76 (-131) mm long, (11-) 21–56 (-101) mm wide, ovate, deltoid or elliptic; apex acuminate; base cordate, obtuse or cuneate; 3–5-lobed; margin coarsely serrate; sparsely velutinous or glabrous on adaxial surface and velutinous on abaxial surface; main veins 3 to 5, nerves flat or sunken on adaxial side and elevated on abaxial side; petiolulate. Inflorescence panicle-cymes or cymes, axillary; pedicels velutinous, trichotomously branched; bracts and bracteoles leaf-like, elliptic or lanceolate, chartaceous, sparsely velutinous on adaxial side and densely velutinous on abaxial side. Flowers c. 15–25 mm diam., yellowish-green or pale yellow, spreading. Sepals 4, c. 9–15 mm long, 3–5 mm wide, obovate-oblong or obovate-lanceolate; apex acuted; base cuneate or obtuse; glabrous or sparsely velutinous inside and densely villose outside. Stamens numerous, c. 4–8 mm long, glabrous, centripetal, inner ones shorter; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective shorter than or equal to the pollen sacs; filaments linear and flat. Carpels numerous, with golden sericeous. Fruits c. 16–38 mm long; achenes c. 2.5–5 mm long, ovate-elliptic or elliptic, convex on both sides, dark brown or nearly black, pale yellow velutinous hairs; style persistent and lengthening to become caudate after anthesis, with pale yellow bearded hairs.

Flowering season in Taiwan starts from late spring to summer (April to September); fruiting season is from July to October.

Distribution: The Himalayan region (eastern Pakistan, northern India, Nepal, Bhutan and Xizang), Southwest, Central China and Taiwan.

Habitat and Ecology: It is growing in open land, stream sides or forest margins throughout the whole island and also adjacent islands, *i.e.* Layu, Ludao and Kueishandao, from sea level to an altitude about 2500 m. Fig. 8

7a. *Clematis henryi* var. *henryi*.

A scandent perennial woody vine. Stem sulcate, velutinous when young and glabrous at maturity. Leaves simple, opposite, rarely whorled, subcoriaceous to chartaceous; petiole tendrillate, c. 34–60 mm long. Leaves ovate-lanceolate or oblong-lanceolate, c. (70-) 89–149 (-194) mm long, (21-) 39–62 (-75) mm wide; apex acuminate; base cordate; unlobed or sometimes basal leaves 3-lobed; margin remotely serrate, mucronately serrate, rare entire; glabrous on both surfaces or velutinous along the vine on abaxial surface; main veins 3 to 5, nerves flat or sunken on adaxial side and elevated on abaxial side. Flowers solitary, rarely dichasic, c. 15–25 mm diam., white, turning yellowish-green or yellowish-brown when dry, campanulate, pendent, recurved at the tip; axillary or terminal; pedicels albo-velutinous, with 2-3 or more pairs of bracts, decussate, chartaceous, subulate or linear, glabrous on adaxial side and pubescent on abaxial side. Sepals 4, c. 15–25 mm long, 5–12 mm wide, oblong or ovate-oblong; apex acute; base cuneate; alovelutinous outside and glabrous except tip and margin inside. Stamens numerous, c. 10–12 mm long, pubescent, centripetal, inner ones shorter; anthers linear, with lateral longitudinal dehiscence; connective equal to the pollen sacs, glabrous on both sides; filaments linear, dilated near base, glabrous on adaxial side, pubescent on lateral and abaxial sides. Carpels numerous, pubescent. Fruits c. 27–44 mm long; achenes c. 3–4 mm long, narrowly ovate or elliptic, convex on both sides, reddish-brown, or purplish-brown, velutinous hairs; style persistent and lengthening to become caudate after anthesis, with pale yellow bearded hairs.

Flowering season during winter, late October to February of the following year; fruiting season November to April or May.

Distribution: Southwest, Central, East and Southeast China and eastward to Taiwan.

Habitat and Ecology: It is growing in open land, stream sides or forest margins at altitudes between 800 and 2500 m.

Specimens examined:

Type: Taiwan: Nantou: Montibus Centralibus, *T. Kawakami & Mori* 1854 (lectotype is designated here: TI!; isolectotype: TAIF!)

A scandent perennial woody vine. Stem sulcate, usually velutinous and glabrous at maturity. Leaves ternately compound, opposite, rarely whorled, subcoriaceous; petiole tendrillate, c. 26–55 mm long. Leaflets 3, sometimes basal leaves simple, terminal segment c. (53-) 71–110 (-134) mm long, (9-) 17–29(-36) mm wide, oblong-lanceolate or ovate-lanceolate; apex acuminate; base cuneate or obtuse, and oblique on lateral leaflets; usually unlobed but 3-lobed on simple leaflets; margin sparsely serrulate, rarely entire; glabrous on both surfaces; main veins 3, nerves flat or sunken on adaxial side and elevated on abaxial side; petiolulate. Flowers solitary, rarely dichasic, c. 15–25 mm diam., white, turning yellowish-brown when dry, campanulate, pendent, recurved at the tip; axillary or terminal; pedicels albo-velutinous, with 2–3 or more pairs of bracts, decussate, chartaceous, subulate or linear, glabrous inside and pubescent outside. Sepals 4, rarely 5 or 6, c. 15–25 mm long, 5–12 mm wide, oblong or ovate-oblong; apex acute; base cuneate; albovelutinous outside and glabrous except tip and margin inside. Stamens numerous, c. 7–17 mm long, pubescent, centripetal, inner ones shorter; anthers linear, with lateral longitudinal dehiscence; connective shorter than the pollen sacs, glabrous on both sides; filaments linear, dilated near base, glabrous on adaxial side, pubescent on lateral and abaxial sides. Carpels numerous, with white sericeous hairs. Fruits c. 28–40 mm long; achenes c. 3–5 mm long, narrowly ovate or elliptic, convex on both sides, brown, velutinous hairs; style persistent and lengthening to become caudate after anthesis, with pale yellow bearded hairs.

Flowering season during winter, November to February of the following year; fruiting season January to April.

Distribution: Endemic to Taiwan.

Habitat and Ecology: It is growing in open land and forest margins around the Central Mountains and Alishan Mountains at altitudes between 1000 and 2500 m.

Specimens examined:

Taoyuen: Balin to Mt. Lalashan, Yang 1927 (TAI). **Taichung:** Mt. Nanhuashan, Yang 329A (TAI). **Nantou:** E-W Cross Island Highway 103-111K, Yang 2673 (TNM). **Kaohsiung:** S. Type: Taiwan: Hualien: Shukoran (Hsiukuluanhsia), S. Nagasawa 611 (holotype: TI!; isotype: KYO!)

A scandent perennial deciduous woody vine. Stem sulcate, with gland hairs when young and glabrous at maturity. Leaves biternate or flammuliform, the first several leaves usually alternate in the juvenile stage or on new branches and changing to opposite; chartaceous; petioles tendrillate, c. 43–67 mm long, connate and enlarged at the node. Leaflets 9 to 15, sometimes to 21 or more, 5-leaflets at the pedicel or near the base, c. (38-) 47–72 (-86) mm long, (13-) 18–34 (-48) mm wide, ovate or ovate-lanceolate; apex acuminate or acute; base cuneate, truncate or cordate, lateral segments oblique; 1 to 3-lobed; margin serrulate to double-serrate; sparsely velutinous or subglabrous on adaxial surface; glabrous or sparse velutinous along vein on abaxial surface; main veins 3 to 5, nerves flat or sunken on adaxial side and elevated on abaxial side; petiolule tendrillate. Inflorescence cymes, axillary; pedicels glabrous or nearly so; trichotomously branched; bracts leaf-like, lanceolate, glabrous or nearly so on both sides. Flowers c. 15–25 mm diam., pale pink, pink, or sometimes white, turning brown when dry, campanulate, pendent, recurved at the tip. Sepals 4, c. 10–25 mm long, 5–10 mm wide, oblong or oblong-ovate; apex acute; base obtuse; glabrous on both sides except the recurved tip; nerves convex ridge-like on abaxial side. Stamens numerous, c. 10–20 mm long, pubescent, centripetal, inner ones shorter; anthers oblong or linear, with lateral longitudinal dehiscence, glabrous on both sides; connective equal to the pollen sacs or shorter, glabrous on both sides; filaments linear, flat and dilated near base, sericeous on both sides, extending beyond the anthers. Carpels numerous, with sericeous hairs. Fruits c. 23–35 mm long; achenes c. 3 mm long, ovate or elliptic, convex on both sides, reddish-brown, velutinous hairs; style persistent and lengthening to become caudate, with white bearded hairs.

Flowering season during summer, late June to November, rarely to January next year; fruiting season August to April the following year.

Distribution: The main distribution is in China (south from Jujiang Range and north to Huangho Range, including Provs. Yunnan, Sichuan, Gansu, Shaanxi, Guizhou, Guangxi, Hubei, Hunan, Jiangxi, Guangdong, Anhui, Zhejiang) and eastwards to Taiwan and southern Japan (Ists. Ryukyu, Kyushu, Sikoku and part of Honshu).

Habitat and Ecology: It is growing in open land and forest margins at altitudes between 800 and 3000 m.

Specimens examined:

A scandent perennial evergreen woody vine. Stem sulcate, densely golden velutinous hairs. Leaves ternately compound, opposite, chartaceous; petioles tendrillate, c. 66–117 mm long. Leaflets 3, c. (64-) 73–105 (-138) mm long, (22-) 39–59 (-78) mm wide, ovate-elliptic, or ovate-lanceolate; apex acuminate or acute; base cordate or cuneate, oblique usually on lateral segments; unlobed or rarely 3-lobed; margin dentate or serrate; golden velutinous on adaxial surface and densely golden tomentose on abaxial surface; main veins 3 to 5, nerves flat or sunken on adaxial side and elevated on abaxial side; petiolule tendrillate. Inflorescence dichasial or cymes, axillary; pedicels golden velutinous hairs, trichotomously branched; bracts leaf-like, lanceolate, golden velutinous on both sides; bracteola subulate, golden pubescent. Flowers c. 15–25 mm diam., golden, campanulate, pendent, recurved at the tip. Sepals 4, c. 15–25 mm long, 5–10 mm wide, oblong or ovate-oblong; apex acute; base cuneate; densely golden velutinous outside and glabrous or nearly so inside except recurved tip and margin. Stamens numerous, c. 10–25 mm long, pubescent, centripetal, inner ones shorter; anthers linear, with lateral longitudinal dehiscence, glabrous on both sides; connective shorter than the pollen sacs, glabrous on both sides; filaments linear, flat and dilated near base, glabrous or sparsely hairy on adaxial side, densely sericeous on abaxial side, extending beyond the anthers.

Carpels numerous, with golden sericeous hairs. Fruits c. 35–47 mm long; achenes c. 5–7 mm long, oblong-lanceolate or fusiform, convex on both sides, reddish-brown, golden velutinous hairs; style persistent and lengthening to become caudate after anthesis, with golden bearded hairs.

Flowering season during winter, October to March of the following year; fruiting season November to April of the following year.

Distribution: It is the only species in this group distributed over both Hemispheres and widely distributed in the Old World. The distributed area from India, Himalayan, Southwest, South and Southeast China (including Provs. Yunnan, Sichuan, Guizhou, Guangxi, Hubei, Hunan, Guangdong, Hainan, Fujian), Taiwan, Vietnam, Philippines to Indonesia (Sumatra, Java and Sumbawa) and north to southern Japan (Ryukyu and Kyushu Islands).

Habitat and Ecology: It is growing in open land, stream sides and forest margins at altitudes between 500 and 2200 m.

Specimens examined:

Type: China: Hongkong: Cap. Syng-moon, *non vide*.

Clematis hakkuensis Hay. in scheda, TAI & TAIF; nom. nud.

A scandent perennial woody vine. Stem sulcate, glabrous. Leaves ternately compound, coriaceous; petioles tendrillate, c. 47—76 mm long; stipules absent. Leaflets 3, c. (39-) 61—94 (-123) mm long, (23-) 31—48 (-71) mm wide, ovate, ovate-elliptic or ovate-lanceolate; apex acute-mucronulate; base obtuse or cuneate; unlobed; margin entire; glabrous on both surfaces; main veins 5, nerves elevated on both sides; petiolulate. Inflorescence cymes,

Fig. 9. *Clematis meyeniana* Walp. (Ranunculaceae). 1. Habit; 2. Bracteole, abaxial side; 3. & 4. Sepals, 3, adaxial and 4, abaxial sides; 5. & 6. Stamens; 7. Carpel; 8. Fruit.

terminal or axillary; pedicels almost glabrous or pubescent, trichotomously branched; bracts and bracteoles subulate, coriaceous, glabrous on both sides. Flowers c. 24–52 mm diam., white, spreading. Sepals 4, c. 14–25 mm long, 3–7 mm wide, oblong or oblong-lanceolate; apex acute-mucronulate; base cuneate; glabrous inside and sparsely velutinous outside. Stamens numerous, c. 7–14 mm long, glabrous, centripetal; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective excurrent beyond the pollen sacs, c. 0.3–0.7 mm long; filaments linear and flat. Carpels numerous, with golden sericeous hairs. Fruits c. 21–40 mm long; achenes c. 5–9 mm long, lunate or elliptic, compressed laterally, yellowish brown with golden velutinous hairs; style persistent and lengthening to become caudate after anthesis, with golden bearded hairs.

Flowering season starts from spring, March to September; fruiting season is from August to January of the following year.

Distribution: Distributed around Southwest and South China (Provs. Sichuan, Yunnan, Guizhou, Hunan, Guangdong, Guangxi, Jiangxi, Fujien), Hongkong, Taiwan, and southern Japan.

Habitat and Ecology: It is widely distributed in open land or forest margins, usually at an altitude below 2000 m. Fig. 10.

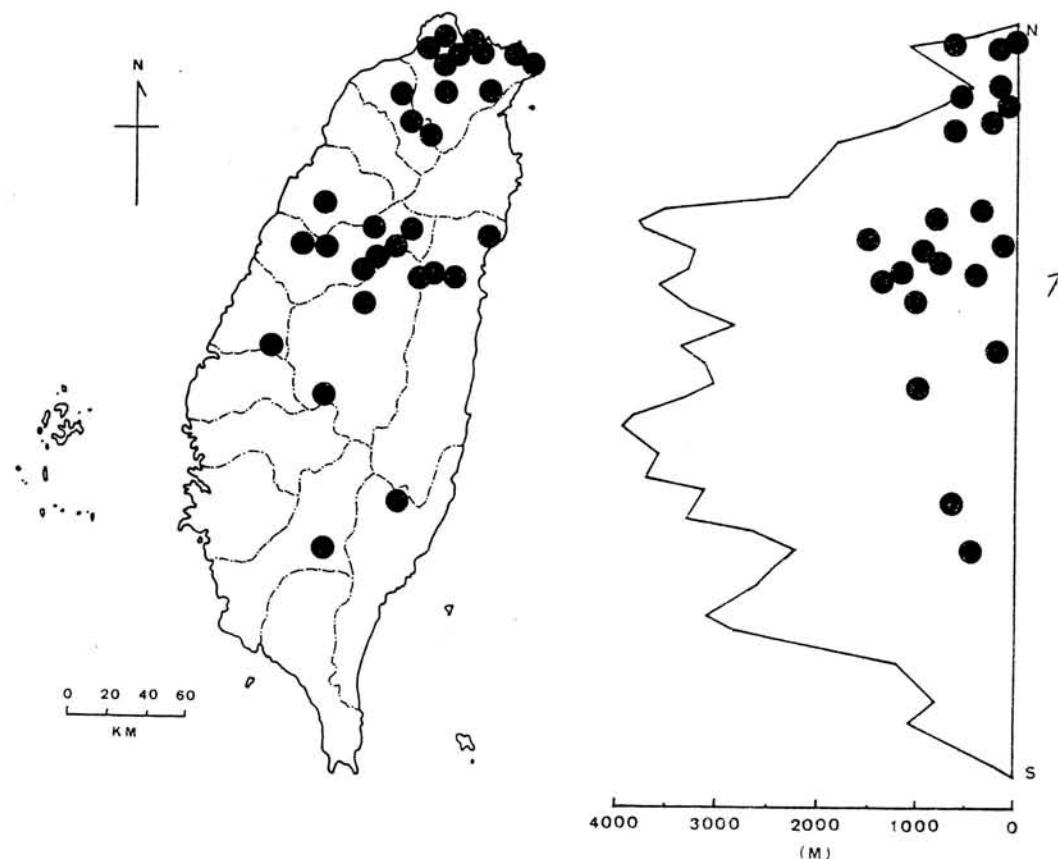

Fig. 10. Latitudinal and altitudinal distribution of *Clematis meyeniana* in Taiwan.

HONGKONG: Hongkong: Isl. Lantau, Ngong-Ping, *S.Y. Hu* 10710(PE).

JAPAN: Pref Kagoshima, Isl. Tokunoshima, Oshima-gun, Kamezu, *J. Murata & Endo* 137 (KUN), Koshima, *J. Murata* 10386 (KUN). **Ils. Ryukyu:** Isl. Kumezima, Nakazatoson, Taiya, 200 m, *T. Yamazaki* 1692 (PE).

Note: The distribution of *C. meyeniana* is through southwestern and southern China, Hongkong, and on Taiwan and southern Japan (Figure 11). Plants with glabrous pedicels are normally found in Taiwan whereas pubescent or subpubescent pedicels are present mainly in Hongkong and parts of Mainland China. In Taiwan, there are also a small group with pubescent / subpubescent pedicels, e.g. *S. Y. Lu* 14893 (collected in Taichung) and *E. Matuda Ran.* 7 (collected in Pingtung). The character of pedicels pubescent or glabrous could therefore be considered as a continuous variation.

Clematis insulari-alpina Hayata, Icon. Pl. Form. 3: 3. 1913. Type: Montibus Formosae, U. Mori s.n. Jul 1912 (holotype: TI!)

A scandent perennial deciduous woody vine. Stem round, sulcate, pubescent and turning glabrous when mature. Flower buds produced in the leaf-axils of last year's shoots, winter buds, new buds possessed branches only. Leaves ternately compound, sometimes pinnate, chartaceous, opposite; petioles tendrillate, c. 36–61 mm long; stipules absent. Leaflets 3 to 5, c. (22-) 37–59 (-72) mm long, (10-) 16–31 (-47) mm wide, ovate or ovate-lanceolate; apex acuminate; base cuneate or obtuse; 1 to 3-lobed; margin irregularly serrate; pubescent on both surfaces or sparsely velutinous on adaxial surface; main veins 3, nerves flat or sunken on adaxial side and elevated on abaxial sides; petiolulate. Inflorescence fasciculate, axillary; pedicels densely velutinous, trichotomously branched. Flowers c. 30–72 mm diam., white, spreading. Sepals 4, c. 20–40 mm long, 10–25 mm wide, elliptic or obovate; apex obtuse-mucronulate; base cuneate; glabrous inside and densely velutinous outside. Stamens numerous, c. 5–10 mm long, glabrous, centripetal; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective excurrent beyond the pollen sacs, c. 0.13–0.17 mm long; filaments linear and flat. Carpels numerous, ovary glabrous and style with white sericeous hairs. Fruits c. 38–55 mm long; achenes c. 3–5 mm long, round or elliptic, convex laterally, brown to dark brown, glabrous; style persistent and lengthening to become caudate after anthesis, with pale yellow or yellow bearded hairs.

Flowering season April to July; fruiting season July to August.

Distribution: This species occurs from Southwest China (Provs. Yunnan, Sichuan and Guizhou) westwards to the Himalaya area (including Nepal, Sikkim, northern India and Xizang), eastwards to Central, South and Southeast China (Provs. Hubei, Hunan, Guangxi, Jiangxi, Anhwei, Fujian) to Taiwan, and northeastwards to North China (Provs. Shaanxi, Gansu and Ningxia).

Habitat and Ecology: It is growing in alpine grassland or associated with shrubs around the Central Mountains, Hsueshan Mountains, Yushan Mountains at an altitude above 2500m. Fig. 13

12. *Clematis parviflora* Gard. ex Champ. subsp. *bartlettii* (Yamam.) T.Y.A. Yang et T.C. Huang, stat. nov. 巴氏鐵線蓮 Fig. 14

Clematis bartlettii Yamam. in Trans. Nat. Hist. Soc. Form. 20: 101. 1930.

Type: Taiwan: Taihoku (Ilan): between Doba (Tucheng) (1,460 ft) and Taiheisan (Mt. Taipinshan) (4,880 ft), H.H. Bartlett 6011 (holotype: TAI!; isotypes: TAI!, US!).

Clematis matsudai Hay., in scheda at US; nom. nud.

A scandent perennial herbaceous vine. Stem olive or green, sulcate, glabrous when matured. Leaves biternately or bipinnately compound, chartaceous; petioles tendrillate, c. 46–71 mm long; stipules absent. Leaflets 9–15, c. (24-) 42–66 (-86) mm long, (4.0-) 15–33 (-57) mm wide, ovate or ovate-oblong, sometimes oblong-lanceolate; apex acute; base cuneate or obtuse; 3-lobed; margin serrate or coarsely serrate, rarely entire; sparsely

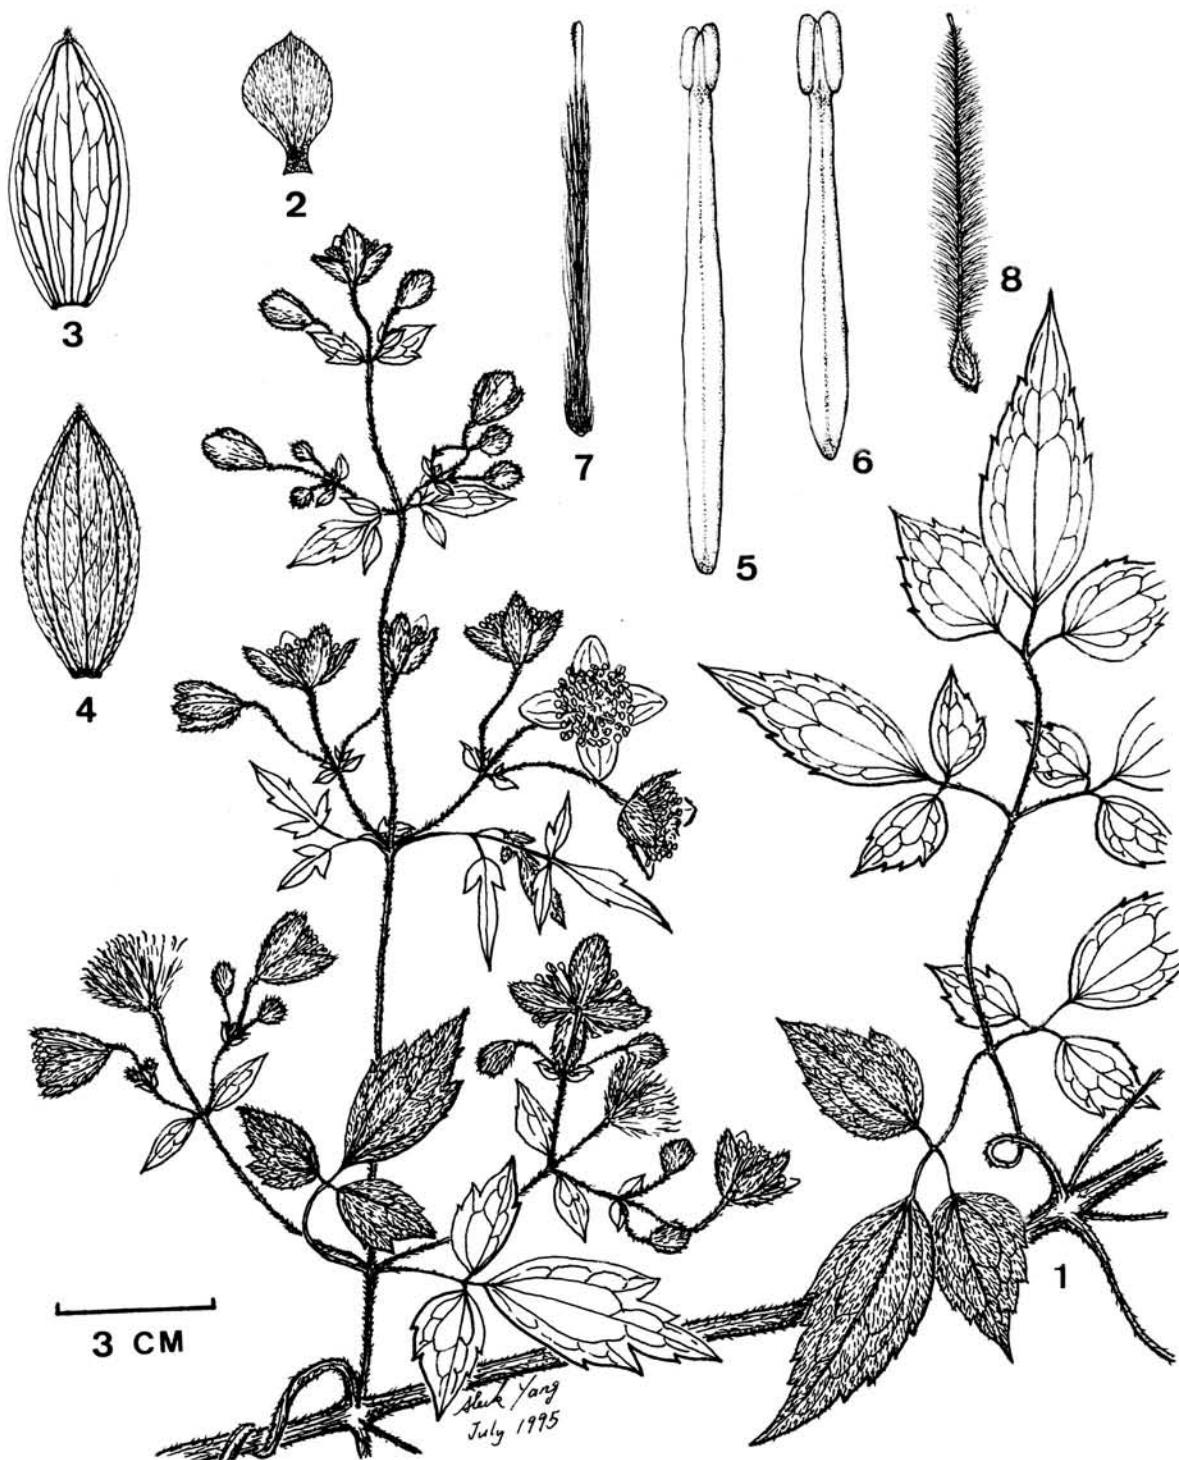

Fig. 14. *Clematis parviloba* subsp. *bartlettii* (Yamam.) T.Y.A. Yang et Huang (Ranunculaceae). 1. Habit, 2. Bracteole, abaxial side; 3. & 4. Sepals, 3, adaxial and 4, abaxial sides; 5. & 6. Stamens; 7. Carpels; 8. Fruit.

velutinous or at least along nerves on adaxial surface; densely albovelutinous on abaxial surface; main veins 3, rarely 5, nerves flat or sunken on adaxial side and elevated on abaxial side; petiolulate. Inflorescence cymes, axillary; pedicels pubescent, trichotomously branched; bracts ovate, sometimes 3-lobed, glabrous on adaxial side and pubescent on abaxial side. Flowers c. 28–45 mm diam., white when fresh turning dark brown when dry, spreading. Sepals 4, c. 15–25 mm long, 5–12 mm wide, elliptic or ovate; apex acute; base obtuse or cuneate; glabrous or nearly so inside and densely albovelutinous outside. Stamens numerous, inner and outer ones shorter, c. 6–11 mm long, middle ones longer, c. 12–17 mm long, glabrous, centripetal; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective shorter than the pollen sacs; filaments linear and flat. Carpels numerous, with brown sericeous hairs. Fruits c. 20–30 mm long; achenes c. 4 mm long, narrowly ovate or elliptic, convex laterally, dark brown with brown velutinous hairs; style persistent and lengthening to become caudate after anthesis, with goldish brown or reddish brown bearded hairs.

Flowering season mainly July to October; fruiting season late September to November.

Distribution: Endemic to Taiwan.

Habitat and Ecology: It is growing in open land or forest margins, mainly around the Central Mountains, Yushan Mountains and Alishan Mountains at altitudes between 1100 and 2500 m. Fig. 15

Clematis heracleifolia DC. var. *taiwanica* S. Suzuki & Hosokawa in Trans. Nat. Hist. Soc. Form. 23: 96. 1933.

Type: Taiwan: Pingtung: Mt. Mutoo, Hannoki et Adel, T. Hosokawa 5405 (holotype: TAI!; isotypes: TAI!)

An erect perennial deciduous shrub, c. 50–120 cm tall. Stem sulcate, albo-velutinous hairs, turning glabrous at maturity; branches possessing from the previous year axillary bud or older buds with scales. Leaves ternate, opposite, chartaceous; petioles non-tendrillate, c. 56–106 mm long, densely velutinous hairs. Leaflets 3, broadly ovate, ovate or elliptical, c. (45-) 71–110 (-120) mm long, (38-) 56–99 (-128) mm wide; apex acuminate; base truncate or obtuse, lateral segments oblique; 3 to 5-lobed; margin serrate or sometimes coarsely serrate; glabrous or nearly so on adaxial surface and pubescent on abaxial surface; main veins 5, nerves flat or sunken on adaxial side, elevated on abaxial side; petiolules on terminal segment and subsessile or sessile on lateral ones. Inflorescence umbel-like racemose, terminal and axillary, usually clustered; pedicels albovelutinous hairs; bracts chartaceous, subulate or leaf-like with lobed, margin serrate, sparsely velutinous inside and densely villose outside. Flowers c. 10 mm diam., polygamous, pale pink or pale rose, turning brown when dry, tubular, recurved at the tip. Sepals 4, c. 14–20 mm long, 3-4.5 mm wide, oblong-lanceolate to linear, expanded wider above middle, c. 5 mm wide; apex cuspidate; base cuneate; glabrous on adaxial side, sericeous-tomentose on abaxial side. Stamens numerous, c. 4–10 mm long, glabrous on adaxial side, sparsely pubescent on abaxial side; anthers linear, with lateral longitudinal dehiscence, glabrous outside; connective shortly excurrent beyond the pollen sacs, c. 0.06–0.1 mm long; filaments linear, dilated near anther. Carpels numerous, with

albosericeous hairs. In staminate flowers with normal stamens and sterile carpels. Fruits c. 24–49 mm long; achenes c. 3.5–4.5 mm long, ovate or elliptic, convex on both sides, deeply brown, yellow velutinous hairs; style persistent and lengthening to become caudate after anthesis, with yellow bearded hairs.

Flowering season July to September; fruiting season August to October.

Distribution: Endemic to Taiwan.

Habitat and Ecology: It is growing in open land around the Central Mountains and Alishan Mountains at altitudes between 1000 and 2500 m.

Specimens examined:

Nantou: Hsitou, Sanlinhs, T. C. Huang 13084 (TAI). **Chiayi:** Mt. Alishan, S. J. Moore 16481 (TNM). **Pingtung:** Wutai, Ali to Hsiaokueihu, 1135–1315 m, C. C. Liao et al. 559 (A, HAST). **Hualien:** Tayulin, C. S. Kuoh et al. 6915 (TAI). See also in *Taiwania* 37(1): 47–49. (1992)

14. *Clematis tamurae* T. Y. A. Yang et T. C. Huang, sp. nov.

田村氏鐵線蓮 Fig. 16

Type: Taiwan: Pingtung: Manchou, Mt. Nanjenshan, Yang 6119 (holotype: TAI; isotypes: HAST, K, PE, TNM, TNU)

Clematis austro-taiwanensis Tamura in *scheda*, TAI; nom. nud.

Folia bipinnata chartacea 15-foliolata; foliolia angusta ovata vel ovata-lanceolata, integra; achaenia angusta orbicularia vel ovata.

The species differs from *C. parviflora* subsp. *bartlettii* and *C. terniflora* var. *garenbiensis* in having narrowly ovate or ovate-lanceolate leaflets as opposed to ovate or oblong leaflets. Each leaf on *C. tamurae* possesses 15 leaflets as opposed to 3 to 5 (-7) on the leaves of *C. chinensis* and *C. formosana*.

A scandent perennial herbaceous vine. Stem green and turning black when dry, sulcate, pubescent. Leaves bipinnately compound, chartaceous; petioles tendrillate, c. 44–58 mm long; stipules absent. Leaflets 15, c. (37)–46–59(-62) mm long, (8-)12–17(-18) mm wide, narrowly ovate or ovate-lanceolate; apex acuminate; base obtuse or cuneate; unlobed or sometimes 3 lobed; margin entire; sparsely pubescent on both surfaces or sometimes nearly glabrous on adaxial surface; main veins 3, nerves sunken on adaxial side and elevated on abaxial side; petiolulate. Inflorescence cymes, axillary or terminal; pedicels pubescent, trichotomously branched; bracts and bracteoles elliptic or oblong-lanceolate, sparsely pubescent on adaxial side and pubescent on abaxial side. Flowers c. 13–25 mm diam., white, spreading. Sepals 4, c. 10–15 mm long, 4–6 mm wide, elliptic or oblong; apex acute; base cuneate; sparsely velutinous or velutinous inside and densely velutinous outside. Stamens numerous, c. 4–8 mm long, glabrous, centripetal; anthers narrowly elliptic, with lateral longitudinal dehiscence; connective shorter than the pollen sacs; filaments linear and flat. Carpels numerous, with white sericeous hairs. Fruits c. 30–46 mm long; achenes c. 2.8–4.2 mm long, narrowly orbicular or ovate, compressed laterally, brown, yellow velutinous hairs; style persistent and lengthening to become caudate after anthesis, with brown or yellowish-brown bearded hairs.

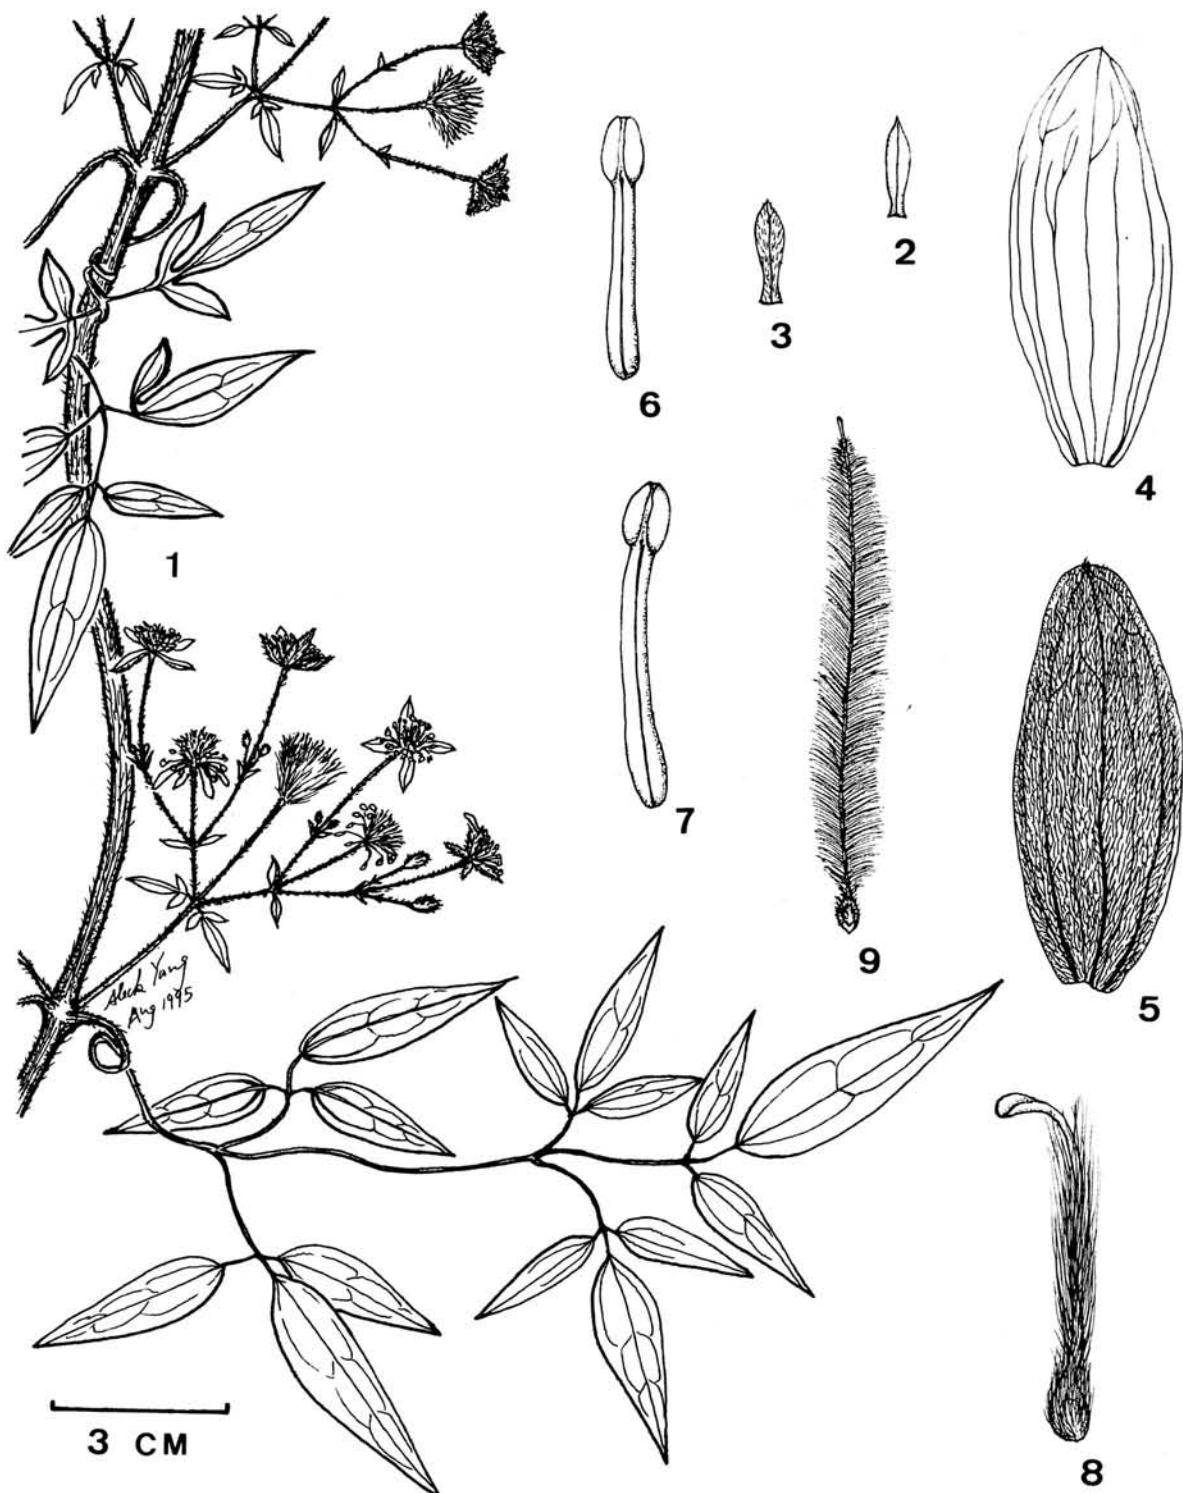

Fig. 16. *Clematis tamurae* T. Y. A. Yang et Huang (Ranunculaceae). 1. Habit; 2. & 3. Bracteoles, 2, adaxial and 3, abaxial sides; 4. & 5. Sepals, 4, adaxial and 5, abaxial sides; 6. & 7. Stamens; 8. Carpels; 9. Fruit.

Flowering season July to September; fruiting season August to October.

Distribution: Endemic to Taiwan.

Habitat and Ecology: It grows in open land or forest margins mainly around the southern part of the Island, but also on central and northern Taiwan at an altitude below 1500 m. Fig. 17

Specimens examined:

Taipei: Chutzuhu, S. Sasaki s.n. Aug 1931 (TAI). **Miaoli:** Erpensung to Hsuechien, 1200-1500m, T.C. Huang & Huang 15385 (NY, TAI). **Kaohsiung:** Chihshan, Tengchi, 1500m, T.C. Note: This new taxon was first noted by Dr. M. Tamura on two sheets of Matuda's specimens collected in Pingtung (both specimens at TAI) and named as *C. austro-taiwanensis*. However, there was no legitimate effective publication of this taxon. We propose this name to commemorate Dr. Tamura in respect of his recognition this new taxon.

Type: Japan: Archipelago Yayama inter Liukiu et Formosa, A. Tashiro 40 (holotype: LE!; isotype: LE!).

Clematis longisepala Hayata in Journ. Coll. Sci. Univ. Tokyo **25**: 41. 1908. Type: Formosa: in monte Morrison, ad 6000 ped. alt., T. Kawakami et Mori s.n. Oct 1906 (holotype: TI!).

Clematis tozanensis Hayata in Journ. Coll. Sci. Univ. Tokyo **25**: 42. 1908. Type: Formosa: in Tozan, in montibus Morrison, G. Nakahara s.n. Oct 1906 (holotype: TI!).

Clematis yingzulinia S.S. Ying in Q. Jour. Chin. For. 20(4): 127; *syn. nov.* Type: Taiwan: Taipei: Pinglin, Yingzulin, S.S. Ying s.n. Sept 1987 (NTUF).

A scandent perennial woody vine. Stem green, sulcate, sparsely pubescent, turning glabrous when mature. Leaves ternately or pinnately compound, subcoriaceous or chartaceous; petioles tendrillate, c. 52–94 mm long, combined together at the base and widely extended; stipules absent. Leaflets 3 to 5, c. (43-) 64–142 (-225) mm long, (31-) 45–84 (-125) mm wide, cordate or ovate; apex acuminate; base cordate; unlobed; margin sparsely serrulate, rarely entire; glabrous on both surfaces; main veins 5, nerves flat or sunken on adaxial side and elevated on abaxial side; petiolulate. Inflorescence dichasic or cymes, axillary; pedicels glabrous, trichotomously branched; bracts and bracteoles elliptic-lanceolate or subulate, subcoriaceous, glabrous on adaxial side and sparsely velutinous on abaxial side. Flowers c. 30–50 mm diam., dark purple, spreading. Sepals 6, sometimes 5 or more than 6, c. 18–30 mm long, 4–8 mm wide, oblong-lanceolate; apex acute; base cuneate; yellowish-brown and glabrous inside, dark purple and densely velutinous outside. Stamens numerous, glabrous, centripetal, inner ones shorter c. 6–8 mm long, outer ones c. 15–22 mm long; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective long excurrent beyond the pollen sacs, c. 0.6–2.0 mm long; filaments linear and flat. Carpels numerous, with white sericeous hairs. Fruits c. 46–74 mm long; achenes c. 6–8 mm long, narrowly ovate or elliptic, compressed laterally, dark brown, sparsely velutinous hairs; style persistent and lengthening to become caudate after anthesis, with white or pale yellow bearded hairs.

Flowering season starts from summer to Autumn, August to October; fruiting season is from October to January of the following year.

Distribution: Only distributed on Taiwan and the Ryukyu Islands.

Habitat and Ecology: It is widely distributed from low to middle altitudes (c. 50–2800 m) around beaches, streamsides, in open land or forest margins. Fig. 19

Clematis terniflora DC. var. *robusta* auct. non (Carr.) Tamura: in Act. Phytotax. Geobot. 15(1): 18. 1953.

A scandent perennial deciduous herbaceous vine. Stem round, sulcate, sparsely velutinous when young and turning glabrous when mature. Leaves pinnately compound, subcoriaceous; petioles tendrillate, c. 17–34 mm long; stipules absent. Leaflets 5, sometimes up to 11, c. (20–) 30–46 (-53) mm long, (12-) 19–29 (-33) mm wide, ovate, cordate or oblong; apex obtuse-mucronulate; base truncate or cordate; unlobed, rarely 3-lobed; margin entire; glabrous on both surfaces; main veins 5, nerves flat or sunken on adaxial side; margin and nerves elevated on abaxial side; petiolulate. Inflorescence cymes, axillary; pedicels glabrous, trichotomously branched; bracts lanceolate, coriaceous, sparsely pubescent on adaxial side or glabrous on both sides. Flowers c. 12–28 mm diam., white, spreading. Sepals 4, c. 5–15 mm long, 2–6 mm wide, elliptic to oblong; apex acute-mucronulate; base cuneate; glabrous or nearly so inside and densely velutinous outside. Stamens numerous, c. 5–8 mm long, glabrous, centripetal; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective equal to or shortly excurrent beyond the pollen sacs, c. 0.05 mm long; filaments linear and flat. Carpels numerous, with white sericeous hairs. Fruits c. 37–46 mm long; achenes c. 5–6 mm long, orbicular or broadly elliptic, compressed laterally, yellowish-brown, pale golden velutinous hairs; style persistent and lengthening to become caudate after anthesis, with pale yellow bearded hairs.

Flowering season July to September; fruiting season July to October.

Distribution: Endemic to Taiwan.

Habitat and Ecology: It has a restricted distribution around coastal areas of southern Taiwan, especially among rocks. Fig. 21

高山鐵線蓮

Type: Taiwan: Taichung: Mt. Nokogoe (Mt. Nengkaoshan), J. Ohwi 3277 (holotype: KYO!; isotype: TAI!)

An erect perennial deciduous small shrub, c. 30–60 cm tall. Stem round with shallowly sulcate, sparsely velutinous hairs, turning glabrous at maturity; branches possessing from the previous year axillary bud or older buds with scales. Leaves ternate or pinnate, opposite, chartaceous; petioles non-tendrillate, c. 33–48 mm long, densely velutinous. Leaflets 3 to 5, c. (13-) 20–34 (-38) mm long, (11-) 15–21 (-28) mm wide, ovate to elliptic; apex acuminate; base truncate or cuneate, lateral segments oblique; 1 to 3-lobed; margin irregularly serrate; pubescent or sparsely pubescent on adaxial surface, sparsely pubescent or subglabrous on abaxial surface; main veins 5, nerves flat or sunken on adaxial side and elevated on abaxial

side; petiolules on terminal segment and subsessile or sessile on lateral ones. Flowers solitary, rarely 3-flowered, c. 10–12 mm diam., polygamous, pale blue or purple, turning brown when dry, tubular, recurved at the tip; terminal; pedicels albo-velutinous hairs; bracts chartaceous, leaf-like, lobed, margin serrate, glabrous or nearly so inside and densely villose outside. Sepals 4, c. 15–20 mm long, 5–7 mm wide, oblong-lanceolate to linear, expanded wider above middle, c. 5 mm wide; apex cuspidate; base cuneate or obtuse; glabrous inside, villose outside. Stamens numerous, c. 6–10 mm long, glabrous on adaxial side sparsely pubescent on connective and filament; anthers linear, with lateral longitudinal dehiscence; connective excurrent beyond the pollen sacs, c. 0.1–0.3 mm long; filaments linear, dilated near anther. Carpels numerous, with albosericeous hairs. In staminate flowers with normal stamens and sterile carpels. Fruits c. 21–30 mm long; achenes c. 4–5 mm long, elliptic, convex on both sides, reddish-brown or dark brown, velutinous hairs; style persistent and lengthening to become caudate after anthesis, with pale yellow or maize bearded hairs.

Flowering season July to September, fruiting season August to October.

Distribution: Endemic to Taiwan

Habitat and Ecology: It is represented in northern part of limestone regions at an altitude above 3000 m, e.g. Nengkaoshan, Chilaishan, Nanhutashan and Tapachienshan.

18a. *Clematis uncinata* var. *uncinata*.

A scandent perennial deciduous woody vine. Stem sulcate, glabrous. Leaves pinnately to bipinnately compound, coriaceous; petioles tendrillate, c. 44–76 mm long; stipules absent. Leaflets 5 or 9, sometimes 7, c. (29-) 56–90 (-113) mm long, (7-) 23–38 (-51) mm wide, elliptic, ovate or oblong, sometimes lanceolate; apex acute or acuminate; base obtuse or truncate; unlobed; margin entire; glabrous on both surfaces, main veins 3 to 5, nerves flat or elevated on both sides; petiolulate, tendrillate, with 1 to 2 articulations. Inflorescence cymes, axillary or terminal; pedicels glabrous or nearly so, trichotomously branched; bracts and bracteoles subulate, coriaceous, glabrous or nearly so on both sides. Flowers c. 10–25 mm diam., white, spreading. Sepals 4, c. 10–15 mm long, 3–5 mm wide, oblong-lanceolate; apex acute-mucronulate; base cuneate; glabrous on both sides except margin velutinous outside. Stamens numerous, c. 3–10 mm long, glabrous, centripetal; anthers narrowly elliptic or linear, with lateral longitudinal dehiscence; connective shortly excurrent beyond the pollen sacs, c. 0.05–0.09 mm long; filaments linear and flat. Carpels numerous, ovary cylindric, glabrous; style with white sericeous hairs. Fruits c. 20–40 mm long; achenes c. 6–8 mm long, cylindric, sulcate, glabrous, black; style persistent and lengthening to become caudate after anthesis, with orange or golden bearded hairs.

Flowering season starts from early summer, June to October; fruiting season is from August to December.

Distribution: Distributed from Southwest China (Provs. Yunnan, Sichuan and Guizhou) eastwards to South and Central China (Provs. Shaanxi, Gansu, Hubei, Guangxi, Hunan, Anhwui, Jiangxi, Guangdong, Fujian, Jiangsu, Zhejiang, Hainan), Hongkong, Taiwan and Veitnam, and northeastwards to South Japan (Kyushu and Honshu).

Habitat and Ecology: It is growing in sunny places or forest margins at altitudes between 1000 and 2500 m. Fig. 23

Note: The species has variable leaflet number and shape. Linear and lanceolate leaflets occur in the young stage, and elliptic, ovate or oblong leaflets common when mature. There are two main numbers of leaflet, i.e. five and nine. The population of five leaflets is represented mainly in northern part of Taiwan and was named *C. uncinata*. The nine leaflets population has a disjunct distribution in Taiwan, i.e. northern and southern parts, and this taxon used to be recognised as *C. alsomitrifolia* (or *C. uncinata* var. *ovatifolia*). The diagnostic character of these two taxa is the leaflet number, *C. uncinata* has five leaflets and *C. alsomitrifolia* is nine. However, the number of leaflets varies from 5 to 7 or 9 on one plant, or sometimes leaves with 5–7-leaflets or 7–9-leaflets occur on the same plant. These two taxa are treated here as one taxon, i.e. *C. uncinata* but further work is needed.

18b. *Clematis uncinata* var. *okinawensis* (Ohwi) Ohwi, Fl. Japan ed. 1. 515. 1953, in Bull. Nat. Sci. Mus. (Tokyo) **33**: 71. 1953; Tamura in Act. Phytotax. Geobot. **34**: 98. 1983. 毛果鐵線蓮 Fig. 22

Clematis okinawensis Ohwi in Act. Phytotax. Geobot. **6**(3): 146. 1973.

Type: Japan: Isls. Ryukyu: Okinawa, Naha, Y. Tokura s.n. (KYO!)

Clematis alsomitrifolia auct. non Hay.: Tamura in Act. Phytotax. Geobot. **15(1)**: 18. 1953.

Clematis trichocarpa Tamura in Act. Phytotax. Geobot. **16**: 79. 1956 Type: Formosa: Raisha, T. Soma 1017 (holotype: TI!).

Clematis okinawensis Ohwi var. *trichocarpa* (Tamura) Tamura in Act. Phytotax. Geobot. **34**: 98. 1983.

Leaflets 5, 7 to 9, sometimes 11, c. (54-)60–85(-98) mm long, (22-)35–48(-52) mm wide. Sepals 4, c. 6–9 mm long, 3–7 mm wide. Carpels numerous, ovary cylindric, pubescent; style with white sericeous hairs. Fruits c. 23–34 mm long; achenes c. 5–7 mm long, cylindric, sulcate, pubescent.

Flowering season April to July; fruiting season August to November.

Distribution: Distributed from Southeast China (Prov. Zhejiang), Taiwan and the Ryukyu Islands.

Habitat and Ecology: It is growing in open land or forest margins, very rare on the southern part of the island below 600 m altitude.

Specimens examined:

Pingtung: Paiwan, E. Matuda s.n. 1916 (TAI). **Taitung:** Senyung, S. Y. Lu 16167 (TAI, TAIF).

Note: This taxon was first reported in Taiwan by Yang and Huang (1986) from only two localities. There is only one diagnostic character whether the ovaries and achenes are pubescent or glabrous which is used to distinguish *C. uncinata* and *C. okinawensis*, and we treat them here as varieties, i.e. *C. uncinata* var. *uncinata* and var. *okinawensis*. However, this variety, var. *okinawensis* also has a variable leaflet number and shape. The number of leaflets varies from 5 to 9; when populations with 5 to 7 leaflets they were assigned to *C. trichocarpa*; when populations with 7 to 9 leaflets they were identified as *C. okinawensis*. As with var. *uncinata*, it is only the variation of leaflet number which give rise to the taxon.

ACKNOWLEDGEMENT

We would like to give our thanks to Mr. J.A. Compton (RNG, University of Reading) for correcting the manuscript; Mr. M. J. E. Coode (RBG, Kew) for commending Latin description. Thanks also extend to the curators of following herbaria: A (also GH), BM, CHIA, E, HAST, HK, K, KYO, LE, NTUF, NY, PPI, TAI, TAIF, TCF, TI, TNM, TNU, US for their kindly loan specimens to the first author to examine.

臺灣毛茛科植物之新見(5)—臺灣鐵線蓮屬

楊宗愈^(1,3) 黃增泉⁽²⁾

(收稿日期：1995年8月12日；接受日期：1995年9月4日)

摘要

本文是臺灣毛茛科(Ranunculaceae)鐵線蓮屬(*Clematis* L.)植物的分類學研究，包括13種、2亞種及5變種，共計20個分類群。其中新種田村氏鐵線蓮(*C. tamurae* T.Y.A. Yang et Huang)及新組合巴氏鐵線蓮(*C. parviloba* Gard. ex Champ. ssp. *bartlettii* (Yamam.) T.Y.A. Yang et Huang)均是首次出現。文中對每一分類群皆有詳細描述，並附其檢索表及部分分類群之在臺分佈圖。

關鍵詞：鐵線蓮屬，毛茛科，分類學，臺灣。
