**ABSTRACT:** Three newly naturalized Asteraceae species are reported in this paper. *Cotula australis* (Sieber ex Spreng.) Hook. f. and *Erigeron bellidoides* DC. are well established and naturalized in urban areas of northern Taiwan. *Ageratina riparia* (Regel) R.M. King & H. Rob. is naturalized to northern and central Taiwan. Descriptions and illustrations of these alien Asteraceae plants are provided.

**KEY WORDS:** Newly naturalized, Asteraceae, *Ageratina riparia*, *Cotula australis*, *Erigeron bellidoides*, Taiwan.

## INTRODUCTION

Asteraceae, one of the largest families of flowering plants, is the major contributor to the naturalized flora globally as well as in Taiwan (Pyšek et al., 2004; Wu et al., 2004; Wu and Wang, 2005). Many naturalized Asteraceae plants were reported in Taiwan in recent years (Chang et al., 2002; Chen, 2007; Chung et al., 2007, 2008; Hsu et al., 2006; Jung et al., 2005, 2006, 2008; Tseng and Peng, 2004; Tseng et al., 2008; Wang and Chen, 2006; Yang et al., 2001; Yang and Hsieh, 2006). Most of them were introduced casually (Chang et al., 2002; Chen, 2007; Chung et al., 2007, 2008; Hsu et al., 2006; Jung et al., 2005, 2006, 2008; Wang and Chen, 2006; Yang and Hsieh, 2006). Several species, such as *Gymnocoronis spilanthoides* DC., were introduced purposely and subsequently escaped and naturalized in the field (Yang et al., 2001). Some newly naturalized Asteraceae plants, such as *Acemella uliginosa* (Swartz) Cass., *Mikania micrantha* Kunth, and *Praxelis clematidea* (Griseb.) R. M. King & H. Rob., which were reported as locally naturalized (Chang et al., 2002; Chen, 2007; Chung et al., 2007; Chung et al., 2008), have become rampant in Taiwan. In this report we document the naturalization of three additional Asteraceae species in Taiwan: *Ageratina riparia* (Regel) R. M. King & H. Rob., *Cotula australis* (Sieber ex Spreng.) Hook. f., and *Erigeron bellidoides* DC. *Cotula australis* and *Erigeron bellidoides* have been well established and naturalized in urban areas of northern Taiwan. *Ageratina riparia* is naturalized in northern and central Taiwan. Descriptions and line drawings of these species are provided.

## TAXONOMIC TREATMENTS

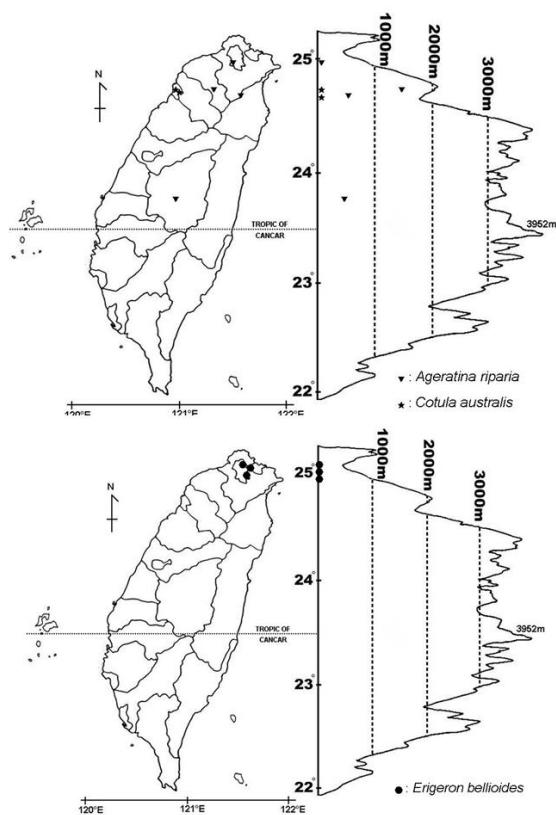

1. *Ageratina riparia* (Regel) R. M. King & H. Rob., Phytologia 19(4): 216. 1970.

### 澤假藿香薊 Figs. 1 & 2

Herb or shrubs, erect, stems pubescent, villous; leaves opposite, petiole 7-15 mm long, blade elliptic, apex acuminate, base attenuate, margin serrate; capitulum turbinate, 5-7 mm in diameter, homogamous, comprising solely of disc florets, arranged as cymose panicles, involucral bracts linear to lanceolate, apex acute, ciliate, ca. 2.5-4 mm long, pappus scabrous, 2.5-3 mm long, attached on a hyaline ring; corolla 5-lobed at apex, abruptly narrowed into a tube in the lower half, whitish, the lobes ciliate adaxially ly, anthers ca. 0.75 mm long; style bifid, exerted; achenes 5-ribbed, ribs hispidulous.

**Specimens examined:** Taiwan. Taipei City, Taipei Botanical Garden (cultivated), 10 Apr 2008, M.-J. Jung 2670 (TAIF). Taipei Co., Wulai Township, Fushan, 23 Feb 2002, P.-H. Lee et al. 1468 (TAIF); Taoyuan Co., Fuhsing Township, Mingchih, 9 May 2006, M.-J. Jung 1439 (TAIF). Nantou Co., Yuchihs Township, Sun Moon Lake, 17 Mar 2008, M.-J. Jung 2461 (TAIF).

**Distribution and note:** The genus *Ageratina* Spach comprises about 290 species in South and North America (Peng et al., 1998). *Ageratina adenophora* was reported as being naturalized at 900-1,500 m altitude in southern Taiwan (Peng et al., 1998). *Ageratina riparia* is native in Mexico and is introduced into Pacific islands including Australia, Hawaii and New Zealand (King and Robinson, 1987; USDA, NRCS, 2004). *Ageratina riparia* has naturalized in northern and central Taiwan in recent years. Both *Ageratina adenophora* and *A. riparia* appear to be triploid apomicts (King and Robinson, 1987). *Ageratina adenophora* and *A. riparia* are notorious weeds in Asia (Hsu et al., 2006). Vernacular names of *Ageratina riparia* include: creeping croftonweed, mist flower, river eupatorium, spreading snakeroot and William Taylor. Leaf shape of *Ageratina adenophora* (deltoid to ovate) and *A. riparia* (elliptic) serves readily to distinguish the two species.

**Fig. 1. Distribution of *Ageratina riparia* (▼), *Cotula australis* (★), and *Erigeron bellidioides* (●) in Taiwan.**

2. *Cotula australis* (Sieber ex Spreng.) Hook. f., Fl. Nov.-Zel. 1: 128. 1852. Kuo, Fl. Matsu: 629. 1994; Walsh and Entwistle, Fl. Victoria 4: 931-934. 1999.  
南方山芫荽 Figs. 1 & 3

Herbs, erect to ascending, 3-20 cm tall, stems dichotomous, pilose; leaves cauline, alternate, base nearly amplexicaul; blade obovate, 7-35 mm long, 7-15 mm wide, parted, pinnatisect to bipinnatisect, lobes linear, apex acuminate, sparsely to densely pilose, hairs to 2 mm long. Capitulum 3-6 mm in diameter, terminal or axillary, peduncle unbranched, 15-70 mm long; involucral bracts 2-seriate, elliptic, apex round, margin hyaline, 1-nerved, glabrous to sparsely pilose, hairs 0.3-0.5 mm long; florets dimorphic: marginal florets pedicellate, pedicel ca. 0.5 mm long, ovary obovate, papillose, compressed, ca. 0.6 mm long, corolla lacking, pistilate, pistil ca. 0.4 mm long; central florets 1.2-1.5 mm long, ovary glabrous, smooth, corolla tabulate, pale yellow. Achenes obovate, apex round, strongly flattened; achenes of marginal florets 1.2-1.5 mm long, margins thinly winged, wings membranous, style and stigma persistent, ca. 0.3 mm long; achenes of central florets wingless, 1.1-1.2 mm long.

Specimens examined: Taiwan. Hsinchu City, Chertuchi Park, 9 May 2008, M.-J. Jung 2905 (TAIF); Nanya Park, 11 Apr 2008, M.-J. Jung 2677 (TAIF), 9 May 2008, M.-J. Jung 2885 (TAIF); Park of Hsinchu Performing Arts Center, 11 Apr 2008, M.-J. Jung 2682 (TAIF).

Distribution and note: The genus *Cotula* L. has about 50 species mainly from Southern Hemisphere (Peng et al., 1998; Walsh and Entwistle, 1999). One species, *Cotula hemisphaerica*, was reported in Taiwan but rarely collected (Peng et al., 1998). *Cotula australis* is native to Australia and naturalized in America, Canary Island, Chile, Hawaii, Japan, Mexico, New Zealand, S. Africa, and as far north as Norway (Grierson, 1980; Kuo, 1994; USDA, NRCS, 2004). The dispersal of *Cotula australis* from Australia to several other countries was assumed to be associated with imports of Australian grain (Grierson, 1980). *Cotula australis* was also recorded in Matzu, Fujian Province (Kuo, 1994). Recently, *Cotula australis* was found in grassy parks and at roadsides in Hsinchu City, northern Taiwan. Vernacular names of *Cotula australis* include: Australia waterbuttons, Australian brass buyyons, bachelor's button, carrotweed, and common cotula (USDA, NRCS, 2004; Walsh and Entwistle, 1999). Peduncle of *Cotula australis* is much longer than *C. hemisphaerica*. Involucral bracts are elliptic and with prominent membranous margins in *Cotula australis*. In contrast, those of *C. hemisphaerica* are oblong and with scarious margins.

3. *Erigeron bellidioides* DC., Sp. Pl. 2: 863-865. 1753. Walsh and Entwistle, Fl. Victoria 4: 882-885. 1999.  
類離菊飛蓬 Figs. 1 & 4

Herbs, shortly rhizomatous, stem short, leaves rosetted, blade obovate to spatulate, base petiole-like, apex acute, sparsely hirsute, margin entire to shallowly dentate. Capitulum turbinate, solitary, 3-6 mm in diameter, peduncle unbranched, 3-7 cm long, with small bracts; involucral bracts linear, apex acute, margin hyaline, outer bracts ca. 0.5 mm long, pubescent; inner bracts glabrous to pubescent, 0.7-0.8 mm long, ray florets 2-seriate, pistilate, ligules whitish to pale yellow, ca. 0.7 mm long, disc florets bisexual, corolla 5-lobed, whitish to pale yellow, ca. 1.3 mm long, anthers ca. 0.3 mm long; achene uniform, pubescent, pappus 1-seriate, thin, with fragile bristles, subequal to corolla.

Specimens examined: Taiwan. Keelung City, Cidu District, Padu, 9 Jul 2008, M.-J. Jung 3054 (TAIF). Taipei City, Zhongshan District, Dajia Riverside Park, 19 Apr 2008, M.-J. Jung 2699 (TAIF); Nangang District, Academia Sinica Campus, 7 Nov 2005, M.-J. Jung 1313 (NCKU), 28 Jan 2006, M.-J. Jung 1351 (NCKU), 19 Dec 2007, M.-J. Jung 2075 (TAIF).

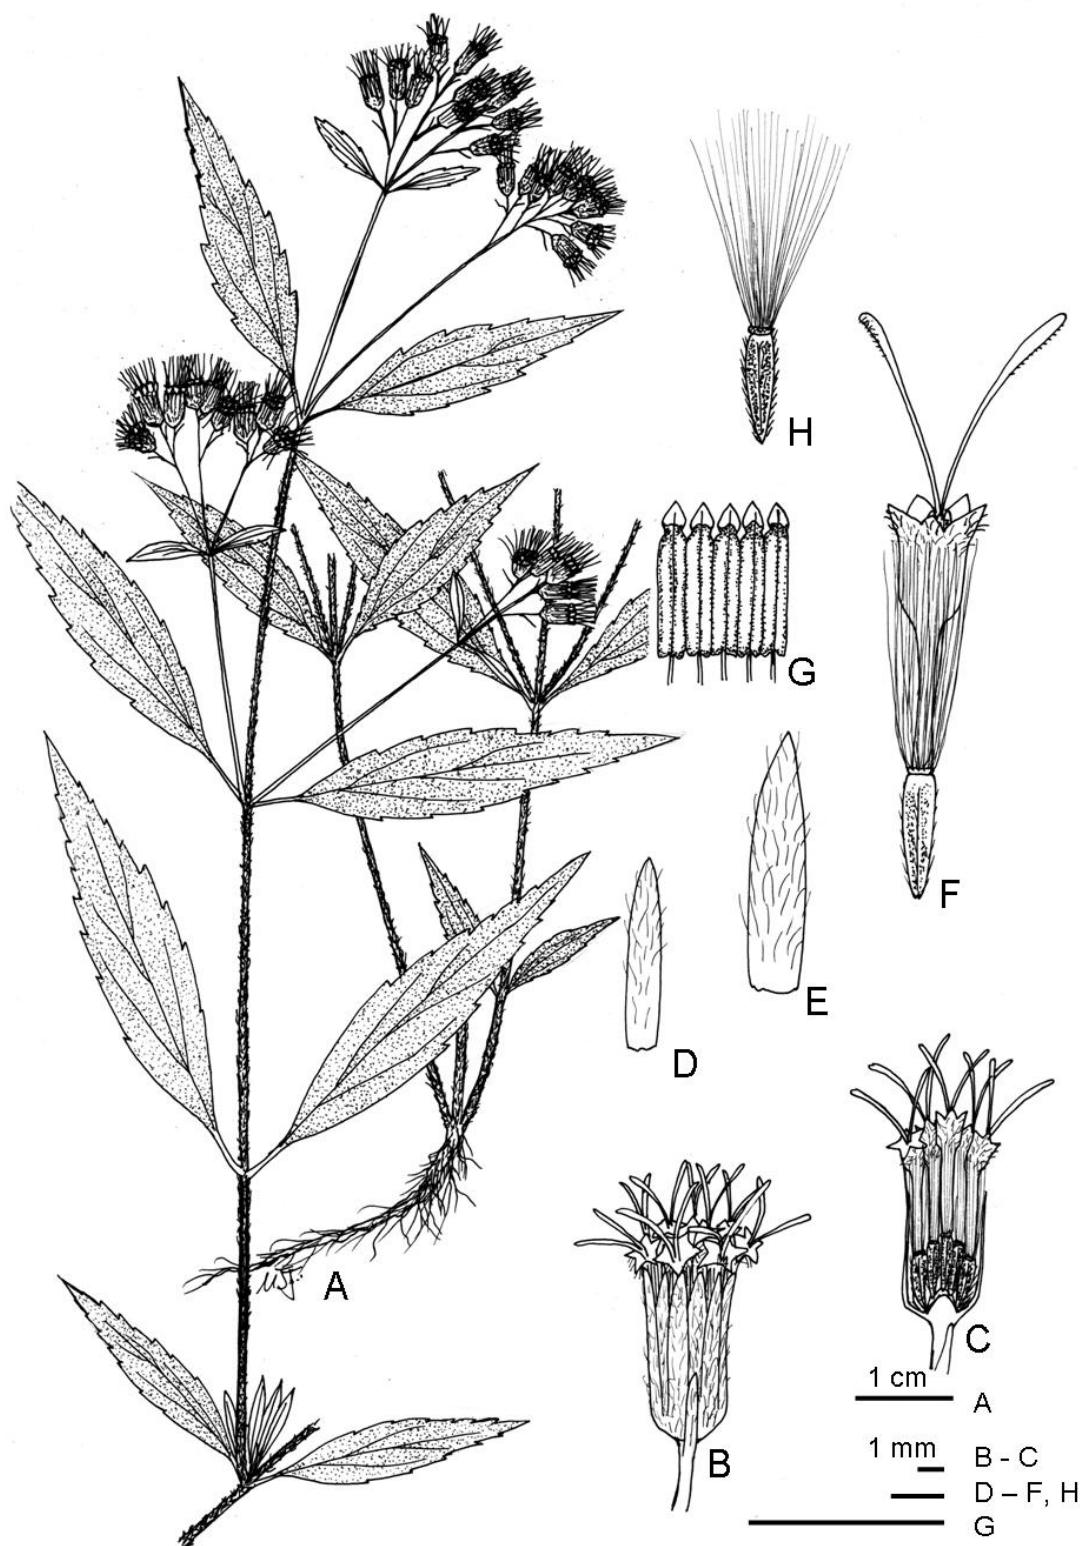

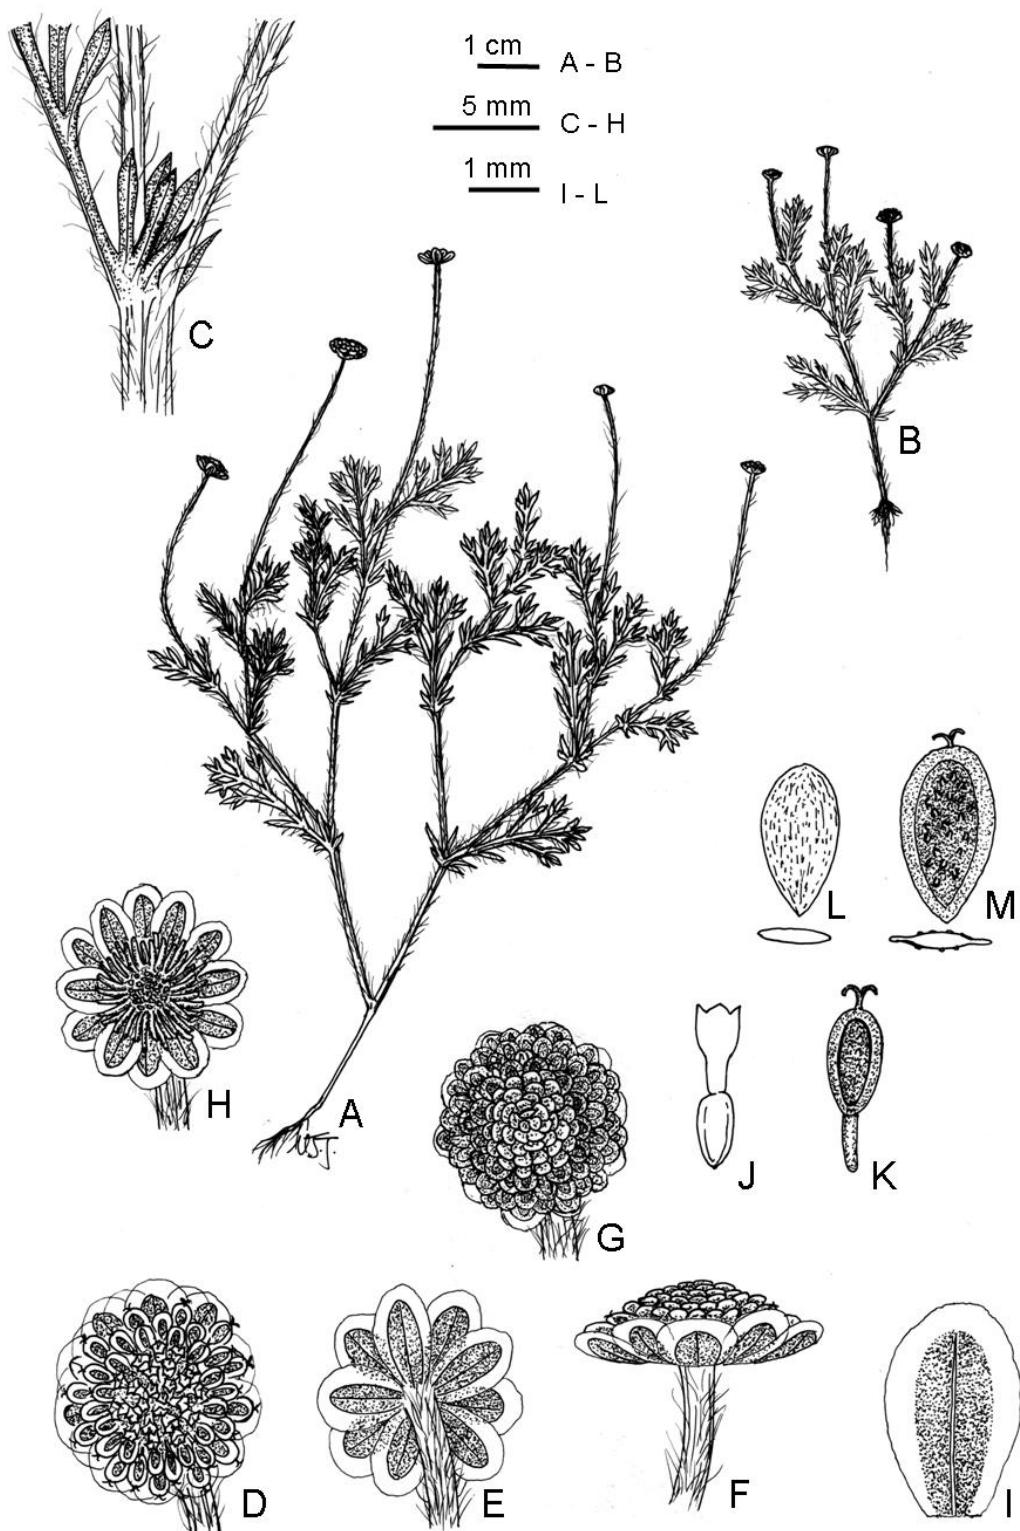

Fig. 2. *Ageratina riparia*. A: Habit. B: Capitulum. C: Dissected capitulum. D: Outer involucral bract. E: Inner involucral bract. F: Floret. G: Anthers. H: Achene.

**Fig. 3. *Cotula australis*.** A and B: Habit. C: Leaf base. D: Capitulum, flowering. E: Capitulum, showing involucre. F: Capitulum, lateral view. G: Capitulum, in fruit. H: Capitulum, showing receptacle and persistent pedicels. I: Involucral bract. J: Central floret. K: Marginal floret. L: Achene of central floret. M: Achene of marginal floret.

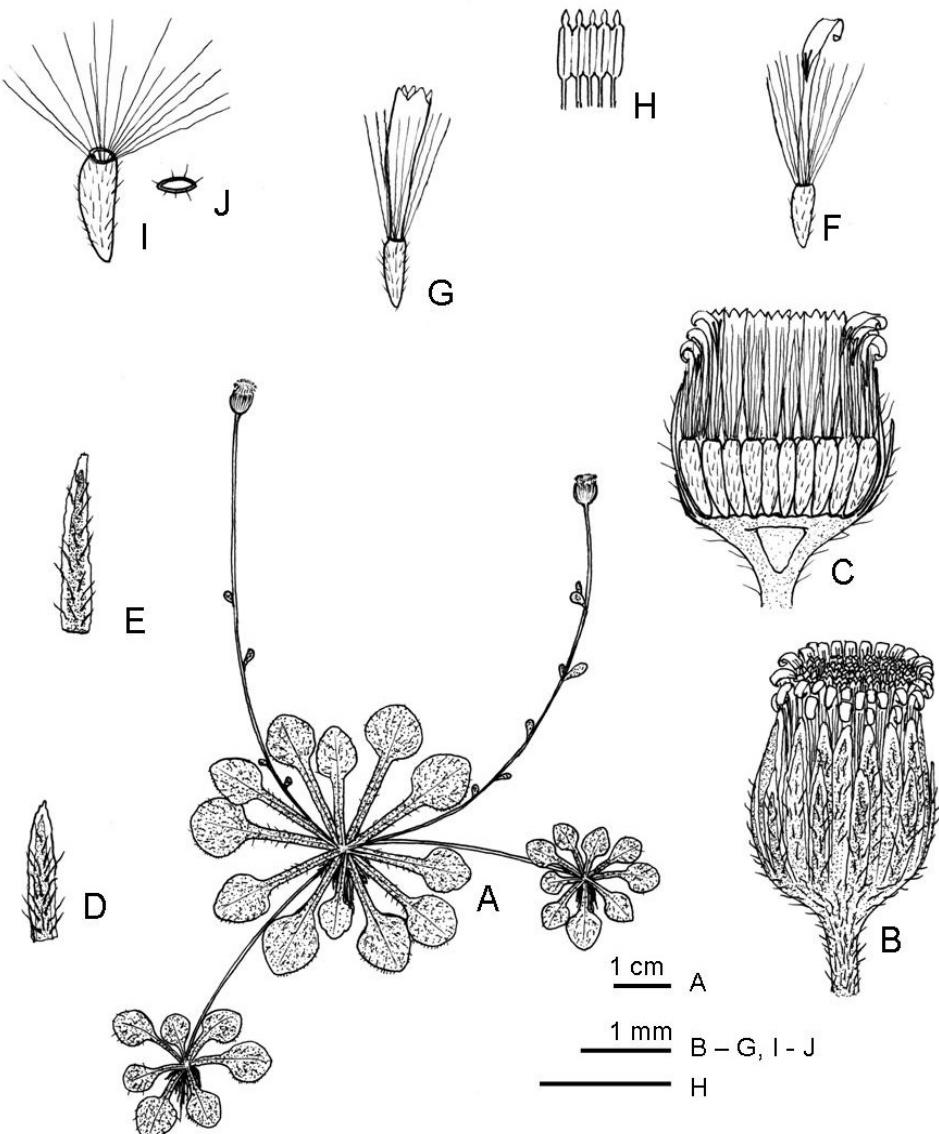

Fig. 4. *Erigeron belloides*. A: Habit. B: Capitulum. C: Dissected capitulum. D: Outer involucral bract. E: Inner involucral bract. F: Ray floret. G: Disc floret. H: Anthers. I: Achene. J: Achene, cross section.

Distribution and notes: *Erigeron* is a cosmopolitan genus of more than 200 species. Two species, one naturalized and the other (with an additional variety) native, were recorded in the Flora of Taiwan, 2<sup>nd</sup> ed. (Peng et al., 1998). *Erigeron belloides* is native in South America; naturalized to Australia, Hawaii and Puerto Rico (USDA, ARS, 2008; USDA, NRCS, 2004; Wagner et al., 1990; Walsh and Entwistle, 1999). In Taiwan, *Erigeron belloides* occurs in grasslands and along roadside in Taipei City, northern Taiwan. Vernacular name of *Erigeron belloides* is bellorita. Dispersal of *Erigeron belloides* was suggested to be associated with the movement of soil (Wagner et al., 1990).
